

GENITOURINARY MEDICINE

Bimanual + Speculum Examination

- Today I examined Mrs Smith, a 28-year-old female who verbally consented for a bimanual + speculum exam. On general inspection, patient was comfortable at rest.
- Vulva and vaginal** inspection found no **abnormalities** (scars, redness, ulcers, masses, discharge, rash)
- Cervix** appeared (1) **closed/open**, (2) **soft/firm**, (3) **short/long**
- Bimanual vaginal exam** revealed **no masses** + **speculum examination** revealed a **healthy** cervix with **closed** external os (Mass, ?bleed, ?ulcers, ? discharge?)
- In summary, these findings are consistent with a normal speculum examination, cervical entropion/cancer, STI.

Introduction	<ul style="list-style-type: none"> Gain consent → explain rationale + guide throughout entire process (will only take a few mins) Will have a chaperone with me Close curtain (allow for privacy) + allow to get undressed 																																								
Positioning critical	<ul style="list-style-type: none"> Don pair of sterile gloves Bum @ edge of bed Modified lithotomy position → Bring heels towards bottom and allow knees to fall to the side → are there stirrups? <ul style="list-style-type: none"> Get one knee to touch one side of the wall and the other leg to lie as flat as possible Put hands underneath her bum OR (If cannula on hand) → Roll up towel and place under bum to prop it up 																																								
Bimanual exam	<ul style="list-style-type: none"> Check for any masses in between: <ul style="list-style-type: none"> endometriosis? uterine fibroids? Cystic Pregnancy? Ante-verted – above cervix (uterus felt anteriorly) Retroverted – below cervix (uterus felt posteriorly) <div style="display: flex; justify-content: space-around;">   </div>																																								
	<div style="display: flex; justify-content: space-around;">   <div style="border: 1px solid black; padding: 5px;"> <p>INSPECT THE VULVA</p> <ul style="list-style-type: none"> SCARS ERYTHEMA MASSES DISCHARGE / BLEEDING RASH / VESICLES </div> </div> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <p>Cystic swelling:</p> <ol style="list-style-type: none"> Congenital cysts (wolffian duct remnant) = anterolateral Vaginal inclusion cyst (episiotomy scars) Solid benign tumours (myoma, papilloma, adenomyoma) </div>

Bartholin's cyst	Lichen sclerosis	Vaginal Candidiasis	Vaginal Prolapse
<ul style="list-style-type: none"> Bartholin's glands (4 + 8 o'clock) secrete to maintain moist vagina Glands may become blocked/infected → cysts (unilateral fluctuant mass +/- tender) 	<ul style="list-style-type: none"> Chronic itchy + inflamed white patches in anogenital area DDx: psoriasis (itchy, red and not well-demarcated plaques) 	<p>Chronic itchy moist curd-like lesions that cannot be scraped off</p>	<p>Asking patient to cough → exacerbate the lump</p>

Itchy Vulva	Red flags:
<ul style="list-style-type: none"> Lichen sclerosis (thinner skin) Vulva vestibulitis (painful) Vulva leukoplakia (precancer mucosal membrane) Chronic lichen simplex <p>Rx: refer to dermatologist if any signs of lichen sclerosis or ulceration</p>	<ul style="list-style-type: none"> Female genital mutilation (FGM) = partial or total removal of external female genitalia e.g. clitoris, labia, narrowed vaginal introitus for non-medical reasons → FGM cases in girls < 18 need to be reported to police Ulcers (HSV) Scarring (PREVIOUS surgery e.g. episiotomy or lichen sclerosis) Vaginal atrophy (post-menopausal women)

STEP 1: PALPATE ABDOMEN + WARM SPECULUM

Inserting the speculum	<ol style="list-style-type: none"> Warn patient that you are going to insert the speculum - double check it is ok → obtain 2nd consent Lubricate speculum Left hand (index, finger + thumb) separates labia Insert speculum SIDEWAYS (BLADE CLOSED, angled DOWNWARDS → down deep) - rest on forchette ROTATE speculum back 90° so handle is facing upwards → BEWARE OF PUBIC HAIR (GO STRAIGHT IN)- rest on forchette OPEN SPECULUM blades until optimal view of cervix achieved TIGHTEN LOCKING NUT to fix position
------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Cervical ectropion

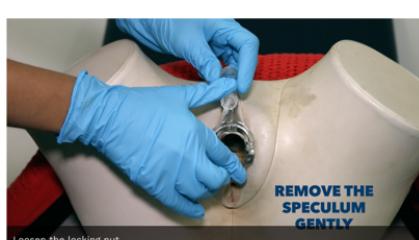

- Metaplasia of columnar epithelial cells** found outside of vaginal cervix (usu. Squamous).
- Red areas** = columnar cells + higher bleeding risk (more vascular) + post-coital bleed
- Pink areas** = normal cervix

Cervical cancer

- Persistent HPV infection** → causing dysplasia (i.e. cervical intra-epithelial neoplasia -CIN)
- Often asymptomatic but** may present w/ IMB, post-coital bleed, increased vaginal discharge/discomfort
- Early stage:** White/red patches on cervix
- Advanced stage:** cervical ulcer, tumour

Visualising the cervix + pap smear	<ol style="list-style-type: none"> Cervical os <ol style="list-style-type: none"> If open? → may indicate incomplete miscarriage Erosions around os → ectropion, early cervical cancer Cervical masses Ulceration - genital herpes (HSV) Abnormal discharge <p>Swabbing guidelines (NAAT) = snapping swab vs charcoal swab</p> <ol style="list-style-type: none"> Double swabs (NAAT (endocervical or vulvovaginal) + high vaginal charcoal Triple swab NAAT (endocervical or vulvovaginal) + high vaginal charcoal + endocervical charcoal 	<p>INSPECT THE CERVIX:</p> <ul style="list-style-type: none"> • CERVICAL ECTROPION • ULCERS • MASSES • DISCHARGE

Toxins and inhibitory substance to prolong viability of pathogens)	M/C/S for gonorrhoea (only after +ve NAAT)	High vaginal = bacterial vaginosis, syphilis, candida, GBS	Remove swab from tube → passby speculum → swab posterior fornix → rotate 10-15s Unlike NAAT (charcoal swab give sensitivities) → needed to guide ABx choice																
Blue smear	Cervical cancer		TWIRL repeatedly → there will be bleeding (warn woman to have extra pads)																
<ol style="list-style-type: none"> LOOSEN locking nut + PARTIALLY close blades ROTATE speculum 90° back to original insertion orientation REMOVE speculum + INSPECT vaginal walls while exiting COVER patient with sheet → Close curtain → Allow patient to redress Dispose equipment into clinical waste bin 	<p>ADDITIONAL THINGS TO DO</p> <ul style="list-style-type: none"> • Bimanual exam to check for any adnexal masses • Cervical motion tenderness → PID, peritonitis 																		
	<p>REMOVE THE SPECULUM GENTLY</p>																		
	<p>REMOVE THE SPECULUM</p>																		
	<p>DISPOSE OF EQUIPMENT INTO CLINICAL</p>																		

Describe the key features required in a sexual history?

- **P – sexually active** – past partner? M/F/Both → Last time having sex + last time w/ different person
 - Male, female or both (**MSM = consider PrEP HIV prophylaxis**)
- **P – relationship** status (regular vs casual) → DFV, Sexual abuse, statutory rape
- **P – sex type** (V/A/O) + protection (condoms) + contraception
- **P – pregnancy plans** → STI status, CST screening (previous?)

Key Differentials:

- 1) Beware of PID – tender uterus, cervical motion tenderness (no other cause identified)
- 2) Most STI (C+G) are asymptomatic (80%) → issue regarding long-term fertility
- 3) Thrush + gardenalla ≠ STI

Investigations and treatment options for Chlamydia & Gonorrhoea?

Chlamydia				Gonorrhoea																					
Epi	< 30 – most commonly reported communicable disease																								
High RF	<ul style="list-style-type: none"> • < 30 + sexually active (MSM, sex workers) • Irregular use of condoms, HIV, IVDU, sexual assault • Partner change or STI in last 12 mths • Pregnant 				<ul style="list-style-type: none"> • MOST common in MSM, heterosexual ATSI • Previous infection does not provide immunity for new infection 																				
Cause	<i>Chlamydia trachomatis / Lymphogranuloma venereum</i> <ul style="list-style-type: none"> • Gram -ve parasitic coccobacilli • <i>Lymphogranuloma venereum</i> • Painless ulcer (stage 1) → lymphadenitis (2) → proctitis (tenesmus) (3) 				Gram-negative diplococci <ul style="list-style-type: none"> ➢ Neisseria gonorrhoeae - infects mucous membranes w/ columnar epithelium (e.g. endocervix, urethra, rectum, pharynx and conjunctiva) 																				
S+S	50-75% asymptomatic		<ul style="list-style-type: none"> • Women Dysuria, mucopurulent genital discharge, IMB, post-coital bleed + dyspareunia, abdo-pelvic cramps/pain • Men urethral d/c and pain, dysuria, testicular/scrotal pain 		80% asymptomatic <ul style="list-style-type: none"> • Dysuria, pelvis/groin/testicular pain • NON-smelly purulent genital discharge (green or yellow) • Conjunctivitis (erythema + purulent d/c) → sight threatening • Prostatitis/cervicitis – perineal pain, dyspareunia • Rectal infection – rectal discomfort and discharge • Pharyngeal infection – sore throat 																				
	<ul style="list-style-type: none"> • Women pelvic adhesions • PID & infertility (fallopian tube scarring) • ectopic pregnancy • Pre-term, PPROM (M/C), LBW • post-partum endometritis • chronic pelvic pain. 		<ul style="list-style-type: none"> • Women PID & infertility (fallopian tube scarring) + pelvic adhesions <ul style="list-style-type: none"> ◦ Fitz-Hugh Curtis syndrome = perihepatitis • Ectopic pregnancy. • Pre-term, PPROM (M/C), LBW • Post-partum endometritis 																						
	<ul style="list-style-type: none"> • Men Epididymo-orchitis 		<ul style="list-style-type: none"> • Men Epididymo-orchitis or prostatitis 																						
	<ul style="list-style-type: none"> • Both reactive arthritis • rectal chlamydia (if lymphogranuloma venereum) 		<ul style="list-style-type: none"> • Both adult gonococcal conjunctivitis → urgent opthal referral • reactive or septic arthritis • Disseminated gonococcal infection (if untreated) → skin lesions, migratory polyarthralgia, tenosynovitis, fever, fatigue 																						
<ul style="list-style-type: none"> • Neonate neonatal pneumonitis, • chlamydial conjunctivitis (few weeks after) 		<ul style="list-style-type: none"> • Neonate neonatal pneumonitis OR ophthalmia neonatorum • gonococcal conjunctivitis (1st week of life) 																							
Ix	Consider screening for other STI (gonorrhoea, syphilis, HIV, Hep A/B/C)				Consider screening for other STI (gonorrhoea, syphilis, HIV, Hep A/B/C)

STI/HIV Testing Tool

STEP 1: Offer to screen + sexual history ask

• Young people (15-29yo)	"STIs are very common in young people and most don't know they have it. So that is why we advise all young people to get tested regularly for STIs. Would you like a check up today?"						
• Reproductive health outcomes	While you're here for advice about contraception/cervical screening, it is good to discuss about your sexual health. Would that be ok with you?"						
• Travel Consultations	"Some people take risks when travelling overseas including having unprotected sex. If you'd like, we could do a sexual check up today before you go and when you return"						
• Hep B vaccination	"Have you had your Hep B vaccination? If not, this vaccine helps to protect against an infection that can be sexually transmitted. Would you like to talk about it further"						
• Asymptomatic BUT starting new relationship	<ul style="list-style-type: none"> FPU (1st) = NAAT/PCR Self-collected Vaginal swab = NAAT Bloods = HHIV (repeat 6 weeks if recent exposure), Hep B and syphilis (repeat 12 wks if recent exposure) 						

STEP 2&3: Testing + contact tracing

	Chlamydia	Gonorrhoea	Syphilis	HIV	Hep A	Hep B	Hep C	Trichomoniasis
Young (15-29)	Annual	Sx + high-risk	Sx + high-risk	Sx + high-risk				Sx + high-risk
Asympt	Annual	Sx + high-risk	Sx + high-risk	If asked				Sx + high-risk
ATSI	Annual	Annual	Annual	esp. rural			esp. rural	Test in remote areas
MSM	3/12	3/12	3/12	3/12			HIV +ve and on PrEP or IVDU	
Sex worker	3/12	3/12	3/12	3/12			Check risk assessment (hep C NAAT)	
IVDU	Annual	Annual	Annual	Annual			esp. rural	
Pregnant	If high-risk (<30yo, ATSI or high prevalent area)	If high-risk (known RFs + high prevalent area)	1 st antenatal visit	1 st antenatal visit			1 st antenatal visit	
Testing (F)	<ul style="list-style-type: none"> Vag swab (self-collected) 1st pass urine endocervical 	<ul style="list-style-type: none"> Vag swab (self-collected) 1st pass urine Endocervical Throat swab (only for sex workers) 	Blood	Blood	Blood	Blood	Blood	<ul style="list-style-type: none"> Vag swab (self-collected) 1st pass urine
Testing (M)	1 st pass urine MSM = <u>throat + rectal swab</u>	1 st pass urine MSM = <u>throat + rectal swab</u>	Blood	Blood	Blood	Blood	Blood	
Test	Chlamydia NAAT (PCR) <i>Highly sensitive dual test that allows self-collection BUT no info about sensitivities and false+ve</i>	Gonorrhoea NAAT (PCR) <i>Highly sensitive dual test that allows self-collection BUT no info about sensitivities and false+ve</i>	Syphilis serology 1) Sore penis 2) Hand/rash 3) neurosyph	HIV Ab/Ag	Anti-HAV Ig total	HBsAg (antenatal) Anti-HBc (acute, chronic, past) Anti-HBs (immunity)	HCV Ab	Trichomoniasis NAAT (PCR)
Contact trace	6/12 Notify public health	2/12	Primary = 3/12 Secondary 6/12 Early latent = 12/12	Check recent partners or needle sharing partners	6/12 prior to Sx Notify public health	6/12 prior to Sx	Treat current partner	

*For syphilis = beware of **Jarisch – Herxheimer Reaction** (fever, rash, chill + headache) after **ABx given** (BenPen -G)

Why **contact trace (via phone, SMS, email, in-person, support service) ?= aim to prevent patient re-infected and reduce community transmission (since most people with STI don't know they have it and can pass it on unknowingly causing long-term health problems*)

- Patient initiated = Contact tracing
- Clinician initiated = anonymously (best for HIV or DFV patients)
- Document and provide info (e.g. www.letmeknow.org.au, www.thedramadownunder.com, (MSM) OR www.bettertoknow.org.au (ATSI)

Investigations and treatment options for STIs

MYCOPLASMA GENITALIUM (MG)		PELVIC INFLAMMATORY DISEASE	Trichomoniasis	Genital Herpes						
	STI	STI Or NON-STI	STI	STI						
Define	Overgrowth of bacteria in vagina due to loss of lactobacilli "friendly" bacteria	Inflammation and infection of organs in pelvis (spread up from cervix) <ul style="list-style-type: none"> ➢ Endometritis ➢ Salpingitis ➢ Oophoritis ➢ Parametritis (CT around uterus) ➢ Peritonitis 	Protozoa parasite w/ flagella that lives in urethra of men and women OR vagina in woman	2 main viral strains that infect sensory nerve ganglia						
Cause	➢ Mycobacteria	Main STIs <ul style="list-style-type: none"> ➢ <i>Neisseria Gonorrhoea</i> (tends to produce more severe PID) ➢ <i>Chlamydia Trachomatis</i> ➢ <i>Mycoplasma Genitalium</i> Main Non-STIs <ul style="list-style-type: none"> ➢ <i>Gardnerella vaginalis</i> ➢ <i>Haemophilus influenzae</i> ➢ <i>E. coli</i> 	<i>Trichomonas</i> parasite with flagella	<ul style="list-style-type: none"> • HSV-1 = cold sores → trigeminal nerve ganglia • HSV 2 = genital herpes → sacral nerve ganglia 						
RF	<ul style="list-style-type: none"> • Multiple sexual partners • XS vaginal cleaning (e.g. soaps, douching, vaginal washes) • Recent ABx • Smoking • Copper coil 	<ul style="list-style-type: none"> • No barrier contraception • Multiple sexual partners • Younger age • Active STI • Previous PID • IUD (e.g. copper) 		<ul style="list-style-type: none"> • Orogenital sex → HSV1 • STI → HSV 2 • Spread via direct contact w/ affected mucosal or viral shedding in mucous secretions 						
S+S	Most are asymptomatic <ul style="list-style-type: none"> ➢ Urethritis ➢ Similar to chlamydia Sx 	<ul style="list-style-type: none"> ➢ Pelvic or lower abdo pain ➢ Abnormal vaginal discharge ➢ Abnormal bleeding ➢ Dyspareunia ➢ Fever ➢ Dysuria Exam <ul style="list-style-type: none"> ➢ Cervical motion tenderness ➢ Cervicitis (inflamed cervix) ➢ Purulent discharge 	50% asymptomatic <ul style="list-style-type: none"> ➢ Vaginal discharge (frothy yellow green) → fishy smell ➢ Itchy ➢ Dysuria ➢ Dyspareunia ➢ Balanitis (inflamed glans) Exam: <ul style="list-style-type: none"> ➢ Strawberry cervix (colpitis macularis) 	Symptoms last 3 wks post-infection <ul style="list-style-type: none"> • Ulcers / blistering lesions in genitalia • Neuropathic (burning, tingling) pain • Flu-like sx (headache, fatigue) • Dysuria • Inguinal LN 						
Comp.	<table border="1"> <tr> <td>Women</td><td> <ul style="list-style-type: none"> • Cervicitis • Endometritis • PID → tubal infertility • Pre-term </td></tr> <tr> <td>Men</td><td> <ul style="list-style-type: none"> • Epididymo-orchitis </td></tr> <tr> <td>Both</td><td> <ul style="list-style-type: none"> • Reactive arthritis </td></tr> </table>	Women	<ul style="list-style-type: none"> • Cervicitis • Endometritis • PID → tubal infertility • Pre-term 	Men	<ul style="list-style-type: none"> • Epididymo-orchitis 	Both	<ul style="list-style-type: none"> • Reactive arthritis 	<ul style="list-style-type: none"> • Tubal scarring – tubal infertility • Chronic pelvic pain • Abscess → sepsis • Ectopic • Fitz-Hugh-Curtis (inflamed liver capsule "Glisson's capsule") – adhesions with liver and peritoneum → bacteria spread from pelvis into peritoneal cavity, lymph or blood → RUQ pain → shoulder tip pain 	<ul style="list-style-type: none"> • HIV risk (since damages mucosa) • Bacterial vaginosis • Cervical cancer • PID • Pregnancy issues (e.g. pre-term delivery) 	<ul style="list-style-type: none"> • Aphthous ulcers (small painful oral sores in mouth) • Herpes keratitis (inflamed cornea in eye) • Herpes whitlow (painful skin lesion on finger or thumb) <p>In pregnancy</p> <ul style="list-style-type: none"> ➢ Neonatal HSV infection (high morbidity and mortality)

Investigations and treatment options for STIs and NON-stis

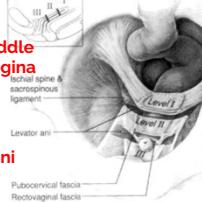

Syphilis		HIV	BACTERIAL VAGINOSIS	Candidiasis
	STI	STI	NON-STI	NON-STI
Define	Bacterial infection through skin and MM → disseminated through body ➤ 21 day incubation period		Overgrowth of bacteria in vagina due to loss of lactobacilli "friendly" bacteria	Vaginal infection by yeast
Cause	Treponema pallidum (spirochete bacteria)	HIV – RNA retrovirus	Anaerobic bacteria ➤ Gardnerella vaginalis ➤ Mycoplasma hominis ➤ Prevotella species	Yeast ➤ <i>Candida albicans</i>
RF	<ul style="list-style-type: none"> Oral, vag or anal sex IVDU Blood transfusion Vertical transmission 	<ul style="list-style-type: none"> MSM Unprotected sex Multiple sexual partners 	<ul style="list-style-type: none"> Multiple sexual partners XS vaginal cleaning (e.g. soaps, douching, vaginal washes) Recent ABx Smoking Copper coil 	<ul style="list-style-type: none"> High estrogen (pregnancy, post-meno) Poorly controlled T2DM Immunosuppression (e.g. steroids) Broad spectrum ABx
S+S	<ul style="list-style-type: none"> Primary = painless chancre + Local LN Secondary = systemic = fever, NS, chills, sweats Latent = Sx disappear but patient still infected Tertiary = Multi-organ affected (CVS, neuro) + gummatus lesions (granulomatous skin lesions) • 		50% are asymptomatic ➤ Fishy smell watery grey discharge ➤ NOT itchy	Asymptomatic ➤ Thick white d/c with no smell ➤ Vulva and vaginal itchy or irritation
Comp.	Neurosyphilis – <ul style="list-style-type: none"> headache, altered behaviour, tabes dorsalis (DC affected), ocular syphilis, (argyll Robertson-pupil – accommodates but does not react) 	AIDs defining illnesses (e.g. <ul style="list-style-type: none"> Kaposi's sarcoma, CMV retinitis, toxoplasmosis, PCP, candidiasis, lymphoma, TB)	<ul style="list-style-type: none"> Increased risk of STI (C+G, HIV) Pregnancy comp. Pre-term labour PPROM M/C Chorioamnionitis Postpartum endometritis LBW 	If severe <ul style="list-style-type: none"> Erythema, swelling, Dyspareunia Excoriations + fissures
Ix	Antibody testing <ul style="list-style-type: none"> Dark field microscopy PCR testing – venereal disease research laboratory (VDRL) TEST for active syphilis with 3-4 wks after primary infection 	HIV antibody testing <ul style="list-style-type: none"> Beware takes 3/12 before infected HIV patient to become positive Requires verbal consent Offer: test p24 antigen <ul style="list-style-type: none"> Tests for specific HIV antigen to get earlier positive result than Ab testing 	Consider screening for other STI (C+G, syphilis, HIV, Hep A/B/C) <ul style="list-style-type: none"> High Vaginal swab (Charcoal – M/C/S) Self-collected low vaginal swab Microscopy <ul style="list-style-type: none"> "clue cells" – epithelial cells from cervix that have bacteria stuck to them 	➤ CHARCOAL Vaginal swab (M/C/S) Test vaginal pH <ul style="list-style-type: none"> pH < 4.5 = candidiasis pH > 4.5 = vaginosis and trichomonas
Mx	Sexual health specialists <ul style="list-style-type: none"> full screen for other STIs lifestyle advice about STI contact tracing prevention of future infections Acute mx <ul style="list-style-type: none"> Deep IM benzathine benzylpenicillin consider cef, Amoxil, doxy 	Acute Mx: <ul style="list-style-type: none"> Anti-retroviral therapy (ART) – given irrespective of CD4 count or viral load Prophylactic co-trimoxazole - protect against PCP Yearly cervical smears – reduce risk of cervical cancer IUTD – flu, pneumococcal, hep A/B, DPT (AVOID live vaccines) POST-exposure prophylaxis <ul style="list-style-type: none"> ART therapy (Truvada and raltegravir for 28 days) HIV test done immediately and 3/12 after exposure Monitor <ul style="list-style-type: none"> CD4 count – susceptibility to infection Viral load – treatment success (aim for < 50) If pregnant <ul style="list-style-type: none"> Viral load < 50 = NVD Viral load > 50 = LSCS Unknown viral load = LSCS + IV zidovudine BF NOT recommended even if viral load undetectable 	If asymptomatic <ul style="list-style-type: none"> WATCH and wait Symptomatic <ul style="list-style-type: none"> Avoid soaps, or anything that disrupts natural flora Metronidazole "flagyl" PO or vaginal gel Advise NO alcohol with metronidazole as causes disulfiram-like reaction (N/V + flushing w/ signs of shock and angioedema) 	Lifestyle <ul style="list-style-type: none"> Keep area dry Avoid track pants, skins Medical (refer to guidelines) <ul style="list-style-type: none"> Anti-fungal creams or pessaries (e.g. clotrimazole) OTC canesten Duo (single fluconazole tablet + clotrimazole cream) Nb: WARN use of antifungal creams/pessaries can damage latex condoms and prevent spermicides from working

PROLAPSE

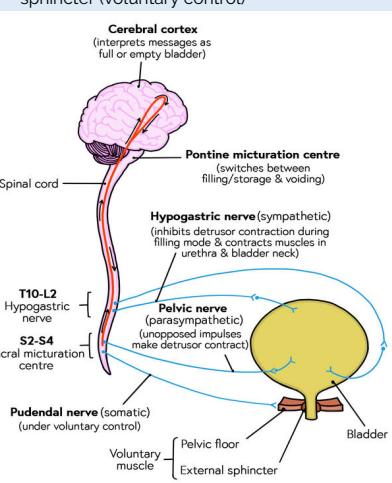

PP	Pelvic Prolapse → ABNORMAL DESCENT OF AT LEAST ONE pelvic organs through supporting fascia of vagina causing displacement of vaginal wall due to			Severity of prolapse	
	1. Loss of levator tone	1. Stage 0 = no prolapse			
	2. Ligament Laxity of endopelvic urogenital hiatus	2. Stage 1 = lowest part of prolapse > 1cm higher than hymen			
	3. Loss of horizontal plate of levator plate	3. Stage 2 = lowest part of prolapse within +/- 1cm of hymen			
Types	Cystocele	Urethrocele	Enterocoele	Rectocele	Uterine prolapse
	Urinary retention	Urethra prolapse	POD prolapse	Constipation (faecal loading)	Uterus prolapse into vagina
RF	Bulge in upper anterior vagina	Bulge in lower anterior vagina	Bulge in upper posterior vagina	Bulge in lower posterior vagina	Beware of procidentia (e.g. uterus prolapse through introitus and exteriorise)
	1. Damage and loss of support to pelvic floor structures (↓ collagen strength)	advanced age (↓ E2 = weakens fascia) multiparous (previous childbirth) Vaginal birth, prolonged 2 nd stage, instrumental birth (forceps, ventouse) LGA infants (>4.5kg), smoking, CT diseases (Ehlers), → HTN, T2DM, increased sexual activity			
Sx	2. ++ intra-abdo pressure	Obesity, intra-abdo mass, chronic constipation OR cough - bronchiectasis repetitive heavy lift			
	• Dragging sensation in pelvis/vagina • "fullness" feeling or seeing a bulge • Low back ache • ALL worsened w/ prolonged standing/exercise, • IMPROVED when supine • bladder, bowel and sexual dysfunction		Exam	• informed consent → Left-lateral position • Inspect vagina → ask patient to cough • Sims speculum lubricated + warm → push down on: o posterior vaginal wall - rectocele o anterior wall - cystocele • Look at cervix and/or vaginal vault • Ask patient to stand up if no bulge found	
Mx	Conservative		Medical		Surgical
	1. Healthy weight 2. Smoking cessation 3. Treat chronic cough/constipation 4. PT referral → advise on Pelvic floor (kegel) exercises 5. Bowel habit training (CBT)	1 st line = Vaginal pessaries (ring, cube, shelf, gelhorn) Silicone devices worn inside vagina Fitted, washed and replaced every 3-4 months A/E = bleed, odour, erosion and occult stress incontinence	Indications: (↑ QoL = NOT cure) Unsuitable for surgery Awaiting surgery Young women w/ future pregnancy plans	Contraindications: Active local infection MESH surgery Non-compliant or sexually active	Patient dependent (what do they want?) → avoid mesh repairs 1. Anterior +/- posterior vaginal repair (colporrhaphy) 2. Uterine prolapse repair 3. Vaginal vault prolapse repair 4. Colpocleisis (close vagina completely) General Complications: 1. General (bleed, infection, VTE) 2. Injury to Adjacent Organs - bowel, bladder, ureters 3. Anaesthetics risk Specific Complications: 1. Urinary Incontinence or retention 2. Dyspareunia OR altered sex experience 3. Surgery failure 4. Recurrence of prolapse

Three Levels of Support: (DeLancey)

- Level I (upper level):**
 - Cardinal/Uterosacral ligaments
- Level II (middle level):**
 - Middle vaginal wall
 - Pubocervical fascia anteriorly
 - Rectovaginal fascia posteriorly
 - Levator ani muscles (through the tendinous fasciae pelvis)
- Level III (lower level):**
 - Perineal membrane + levator ani
 - Urogenital Diaphragm

URINARY INCONTINENCE:

Stress incontinence (outlet incompetence)			Urge Incontinence (detrusor overactivity)	Overflow incontinence	INNervation to Urinate
Issue	Inability of sphincters to hold urine = involuntary urine leakage (esp. on intra-abdo pressure = cough / sneeze)		Sudden contraction of detrusor muscle when bladder only partially filled → sudden urge to urinate Dry = reaches toilet in time Wet = cannot make to toilet	Underactive bladder causing urine to leak out (incomplete emptying)	<ul style="list-style-type: none"> • PNNS → ACh → detrusor relax (PROPULSION) • SNS → NA → sphincter contracts (STORAGE) • Somatic pudendal → external urethral sphincter (voluntary control)
RF	1) Weak abdo muscles (multipregnancy) 2) + intra-abdo pressure > closing pressure of urethral sphincter = 3) Sphincter tone failure = childbirth trauma 4) Loss of urethral support = post-meno E2 def.	1) UTI 2) Overactive bladder syndrome 3) Bladder Stone/clot/tumour 4) Neuro = T2DM, SCI - stroke, Alzheimer, PD.		<ul style="list-style-type: none"> ➢ MAIN = Chronic urinary retention (e.g. opioid usage) ➢ Obstruction = Urethral stricture, Stones, UTI ➢ Weak bladder muscles = NMD, diabetic cystopathy 	
Exam + Ix	➢ Severity of Sx = freq. of urination, incontinence, nocturnal and # of pads used ➢ Prolapse Sx = fullness, dragging, back ache ➢ Sexual Sx = dyspareunia ➢ Pelvic pain = bladder, pudendal neuralgia (worse on sitting) → if relieved with pudendal block (= NANTES) ➢ •ve Cough/stress test = stress leak ➢ DRE = assess anal sphincter tone + rectocele / prolapses ➢ Neuro exam (L1-S4) - check pelvic tone = perineum sensation + sacral reflex (anal wink) ➢ Check for atrophic vaginitis, pelvic mass, urethral diverticulum	Key notes: 5) Triggers = Advanced age, Smoking 6) URODYNAMIC studies needed		Basic Investigations <ul style="list-style-type: none"> ➢ Intake-void diary (3-5 days) ➢ TVUS + bladder scan (post/ pre-void residual bladder volume - <15% pre = normal) ➢ Uroflowmetry ➢ BSL, HbA1C ➢ UA MSU + M/C/S 	INNervation to Urinate <ul style="list-style-type: none"> • PNNS → ACh → detrusor relax (PROPULSION) • SNS → NA → sphincter contracts (STORAGE) • Somatic pudendal → external urethral sphincter (voluntary control) 
Conserv	➢ Reduce BMI < 25 o NEAT regime PT = Supervised pelvic floor Kegel exercise (if no hip fractures)	➢ ↓↓ fluid intake (esp. ↓ caffeine, ↓EtOH, soda) ➢ Bladder retraining = Timed voiding for at least 6 weeks ➢ Manage constipation ➢ Vaginal pessary (1 st line for prolapses)		Bladder retraining = Timed voiding for at least 6 weeks	
Medical	➢ + metformin (if DM) ➢ Topical estrogen ➢ Duloxetine (SNRI) = 2 nd line if surgery not preferred	➢ Oxybutynin (anti-chol -M3 to ↓ACh - ANTI-SLUDGE) ➢ Mirabegron (B3 agonist - less A/E) ➢ Duloxetine = SNRI → ↑ contract internal urethral sphincter		Local E2 → manage post-meno atrophy Flomax (tamsulosin) in men for both urge and overflow	IMPORTANT DIFFERENTIAL FOR "LEAKY URINE" <ul style="list-style-type: none"> ➢ UTI - "burning, stinging sensation + frequency" ➢ PROLAPSE - fullness ➢ HERNIA - reducible (DDx: incarcerated) ➢ NEURO - MS, DM, Cauda Equina ➢ Transient incontinence [DIAPPERS]
Surgical	➢ Mid-urethral sling - tension free vaginal tape (TVT) ➢ Colposuspensions - stitch antero vaginal wall to pubic symphysis (laparoscopically) Need urodynamic studies BEFORE surgery	➢ Botulinum toxin type A → blocks ACh release → injected directly into bladder via cystoscopy (<i>Pt must self-catheterise as botox can lead to urinary retention</i>) ➢ Neuromodulation (percutaneous sacral stimulation) → posterior tibial or sacral nerve → inhibit reflex contraction of bladder		<ul style="list-style-type: none"> ➢ IDC (self-catheterise) ➢ Continuous bladder drain 	<p>Delirium, infection, atrophic urethritis, pharm, psych, XS urine (caffeine, EtOH), restricted mobility, stool incontinence</p>

*Many have mixed incontinence - address biggest concern of pt to determine best treatment
