

# GYNAECOLOGY

## COMMON COMPLAINTS - DDx

### Irregular Menstruation (abnormal uterine bleed)

**Irregularities in menstrual cycle**, affecting **frequency, duration, regularity of the cycle length** and the **volume of menses**. Irregular menstrual periods indicate **anovulation** (a lack of ovulation) or irregular ovulation. This occurs due to disruption of normal hormonal levels in the menstrual cycle, or ovarian pathology caused by:

- Extremes of reproductive age (early periods or perimenopause)
- Polycystic ovarian syndrome
- Physiological stress (excessive exercise, low body weight, chronic disease and psychosocial factors)
- Medications, particularly progesterone only contraception, antidepressants and antipsychotics
- Hormonal imbalances, such as thyroid abnormalities, Cushing's syndrome and high prolactin

### Abnormal Uterine Bleeding - AUB (PALM COEIN)

Intermenstrual bleeding (**IMB**) refers to any bleeding that occurs between menstrual periods. This is a **red flag** that should make you consider cervical and other cancers, although other causes are more common.

#### Structural causes

- Polyps / ectropion / cysts
- Adenomyosis – **dysmenorrhoea**
- (**> 30 yo**) **Leiomyomas (fibroids)**
- (**> 30 yo**) **Malignancy (endometrial, cervical, vaginal)**

#### Non-structural causes

- Coagulopathies
- (**<20yo**) **Ovulatory issue (PCOS, pregnancy, M/C, hypothyroidism)**
- Iatrogenic / infection (STI) / meds (SSRI, **anti-coags**, contraception)
- (**<20yo**) **Endometriosis**
- Unknown origin

### Dysmenorrhoea (painful periods)

- **Primary dysmenorrhoea** (no underlying pathology)

#### Vs. Secondary Amenorrhoea

- Endometriosis or adenomyosis
- Fibroids ( submucosal)
- Pelvic inflammatory disease
- Copper coil
- Cervical or ovarian cancer

### Menorrhagia (HMB) - (PALM COEIN)

- **Dysfunctional uterine bleeding** (no identifiable cause)
- Extremes of reproductive age
- Fibroids
- Endometriosis and adenomyosis
- Pelvic inflammatory disease (infection)
- Contraceptives, particularly the copper coil
- Anticoagulant medications
- Bleeding disorders (e.g. **Von Willebrand disease**)
- Endocrine disorders (diabetes and hypothyroidism)
- Connective tissue disorders
- Endometrial hyperplasia or cancer
- Polycystic ovarian syndrome

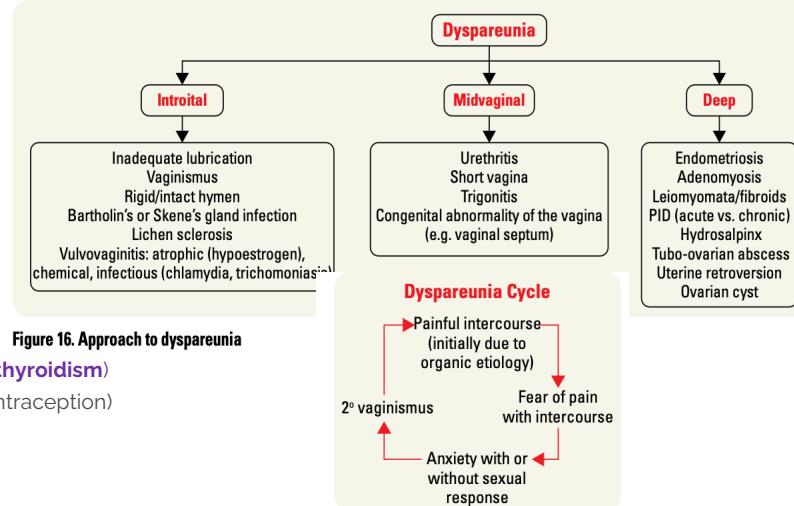

Figure 17. Dyspareunia cycle

#### Investigations for HMB

- Speculum + bimanual = fibroids, ascites and cancers
  - Any AUB → any POC → REMOVE with D+ C
  - Any AUB → foetal body parts → Remove in OT
- FBC (Hb and HCT) = Fe def. anaemia
- Swabs – M/C/S and NAAT (STI)
- Coag screen
- TFT
- Pelvic and TVUS
  - ?fibroids, adenomyosis,
  - Hysteroscopy declined or very abuse
- Outpatient hysteroscopy
  - Suspected fibroids, endometrial cancer, hyperplasia

#### General Mx for HMB

Rx underlying cause

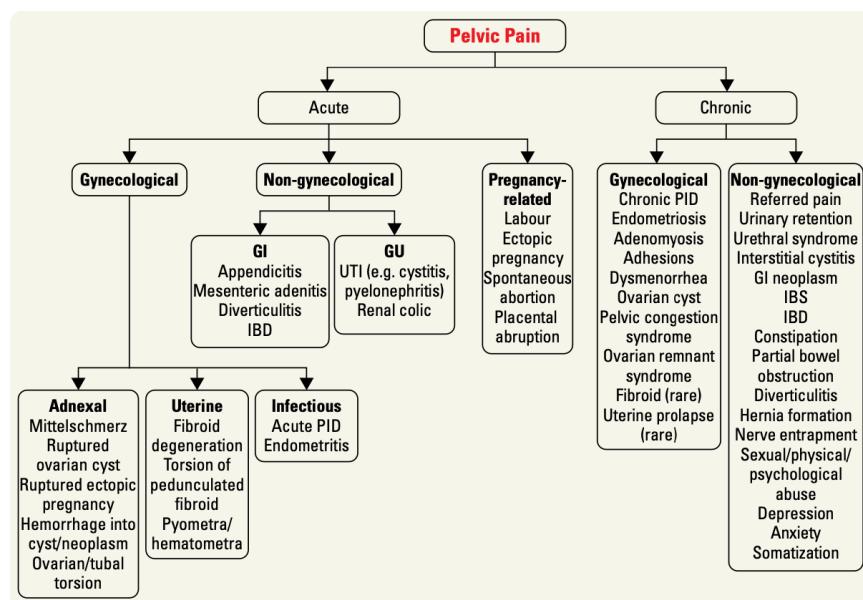

- 1) **IUD (mirena) = 1<sup>st</sup> line**
  - 2<sup>nd</sup> line = cyclical oral progestogens** (e.g. 5mg norethirosterone tds from day 5-26) – esp. if risk factors for high E2 exposure (E.g. obesity, PCOS)
  - 2<sup>nd</sup> line = cyclical estrogen (only if peri-menopausal)**
- 2) **If does not want OCP → ANTI-FIBRINOLYTICS**
  - TXA** (if not in pain) + **NSAID/PPI** OR
  - Mefenamic acid** (if there is pain -NSAID component)
- 3) **Referral to secondary care if treatment unsuccessful**
  - Endometrial ablation** e.g. balloon thermal ablation
  - Hysterectomy**

## Postcoital Bleeding

Postcoital bleeding (**PCB**) refers to bleeding after sexual intercourse. This is a **red flag** that should make you consider cervical and other cancers, although other causes are more common. Often **no cause** is found. The key causes are:

- Cervical cancer, ectropion or infection
- Trauma
- Atrophic vaginitis
- Polyps
- Endometrial cancer
- Vaginal cancer

## Pelvic Pain

### Complications of PID:

- Chronic pelvic pain – abscess, peritonitis
- Ectopic
- Infertility
- Septic arthritis, endocarditis

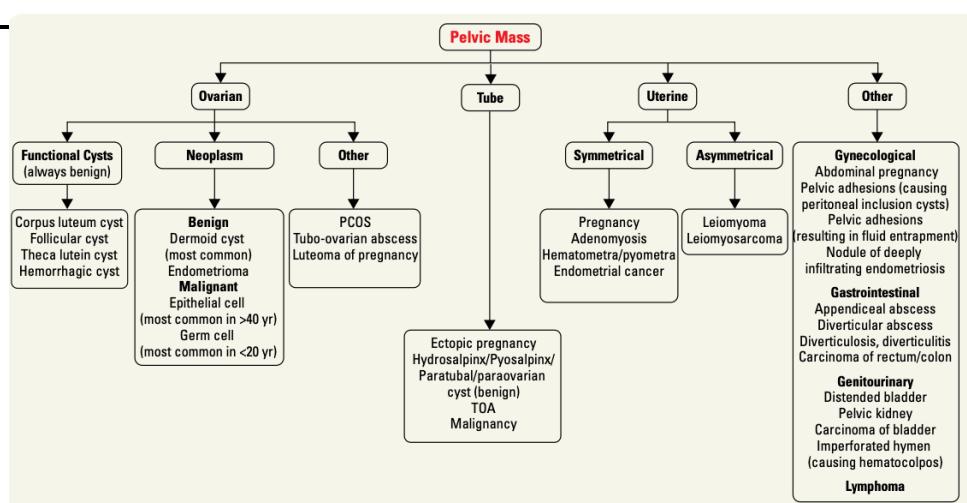

### Toxic Shock Syndrome:

- MOF due to *S. aureus* exotoxin
- RF: tampon use, wound infections, post-partum infections
- Sx: high fever, sore throat, shock, skin peeling on palm and plantar surface
- Rx: Remove infective sources → debride necrotic tissue → B-lactamase ABx

## Vaginal Discharge

- Bacterial vaginosis
- Candidiasis (thrush)
- Chlamydia
- Gonorrhoea
- *Trichomonas vaginalis*
- Foreign body
- Cervical ectropion
- Polyps
- Malignancy
- Pregnancy
- Ovulation (cyclical)
- Hormonal contraception

## Pelvic Mass

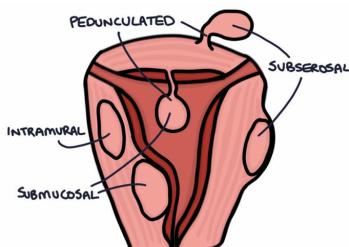

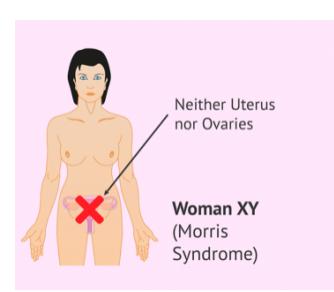

## Pruritus Vulvae

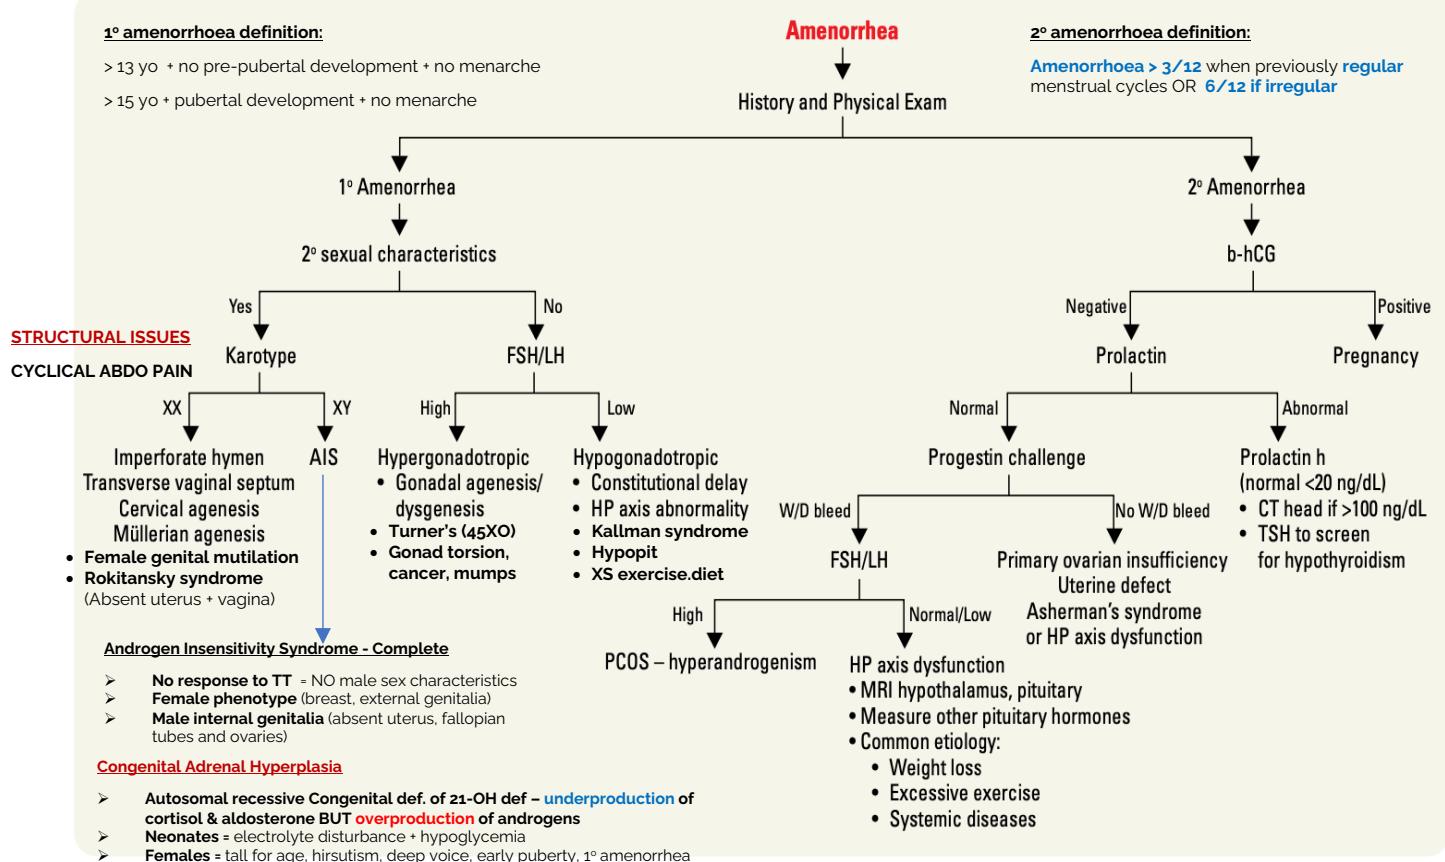

**Pruritus vulvae** refers to **itching** of the **vulva** and **vagina**. There are a large number of causes:

- **Irritants** such as soaps, detergents and barrier contraception
- **Atrophic vaginitis**
- **Infections** such as **candidiasis** (thrush) and pubic lice
- Skin conditions such as eczema
- Vulval malignancy
- Pregnancy-related vaginal discharge
- Urinary or faecal incontinence
- Stress

<b>ALWAYS EDUCATE</b>															

# Diagnostic pathway for a patient presenting with post-menopausal PV bleeding.

## Vaginal Bleeding in Pre or peri-menopausal women

- Pre-menopause** = continuation of regular menstrual cycles w/o changes in the Sx of menstruation transition or hormonal variability.
- Peri-menopause**: about or around the menopause. The average length of this stage is 5 years. Cyclic irregularities increase as women enter this stage with prolonged ovulatory and anovulatory cycles. Levels of FSH and oestradiol oscillate frequently with decreasing luteal function.

## Risk factors for endometrial cancer include:

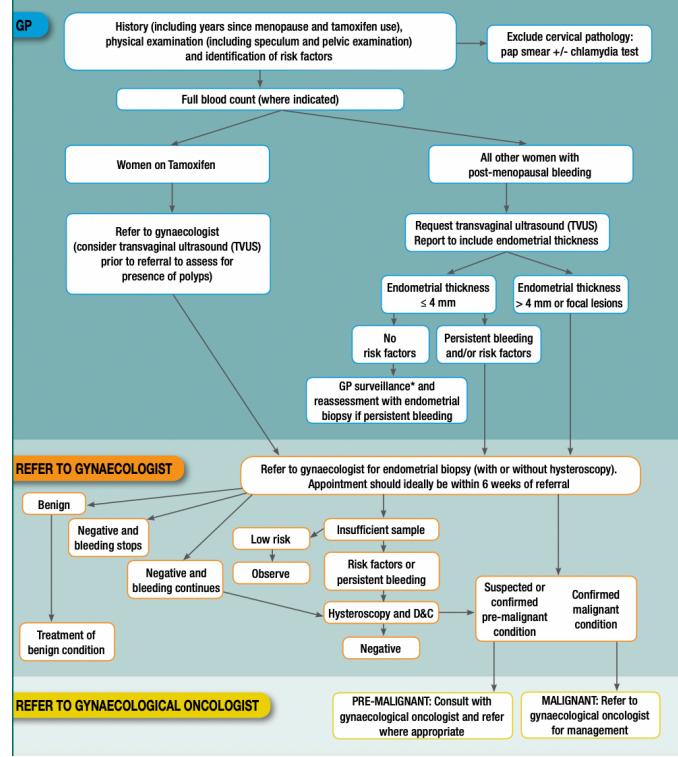

- History of chronic anovulation
- Exposure to unopposed oestrogen (COCP, HRT)
- Polycystic ovary syndrome (PCOS) associated with chronic anovulation
- Exposure to tamoxifen (SERM)
- Strong family history of endometrial or colon cancer (Lynch syndrome)
- Nulliparity
- Obesity (often with diabetes and hypertension)
- Endometrial thickness >8mm (if post-menopausal)

## Investigations include

- Pelvic exam mandatory
- Vaginal speculum exam mandatory
- FBC + ferritin levels Mandatory
- Only if indicated -TFT, coags.

## Vaginal Bleeding in POST-menopausal women

- Post-menopausal bleeding** = spontaneous vaginal bleeding that occurs more than one year after the last episode of bleeding.

## Investigations include

- Pelvic exam mandatory in all post-meno women w/ PV bleed
- TVUS should request endometrial thickness by GP
- Endometrial Biopsy = by specialist (if >4mm thickness = biopsy needed)

## PRACTICE POINTS

<b>Tamoxifen</b>	<ul style="list-style-type: none"> <li><b>Hysteroscopy + Endometrial biopsy</b> required as TVUS has poor sensitivity and specificity for neoplasia in women taking tamoxifen</li> </ul>
<b>HRT</b>	<ul style="list-style-type: none"> <li>Vag bleed or spotting may be normal A/E</li> <li>Abnormal if bleeding persists <b>&gt;6/12 OR if bleeding occurs outside time of progestin withdrawal</b></li> </ul>
<b>Yellow vaginal D/c</b>	<ul style="list-style-type: none"> <li>Does NOT suggest malignancy</li> </ul>

## HRT indications & benefits

- Replacing hormones in **POI** (even if asymptomatic)
- Reduce vasomotor sx in **menopause**
- Improve** sx of low mood, reduced libido, poor sleep and jt pain
- Reduce OP and fractures** risk in women < 60 and low BMD

### Refer to guidelines for specific regimes

- 1) E2 transdermal patch = best to minimise VTE
- 2) Mirena coil best to provide PG + contraception and HMB (less side effects of PG)

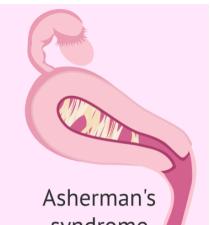

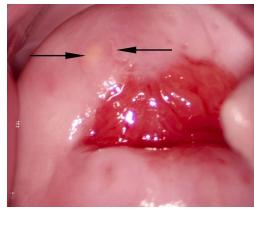

## RISKS

- +Breast cancer** (esp. BRCA mutation)
- + endometrial cancer** (esp. if on tamoxifen) → add cyclical PG to reduce risk given 10-14 days/mth
- + VTE** → use transdermal patches NOT pills to reduce risk (local vs systemic effect)
- + stroke and CAD (STEMI)**

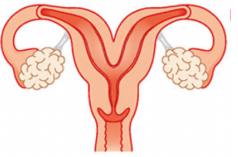

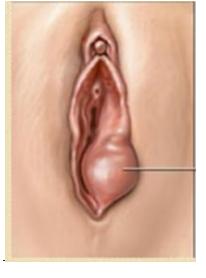

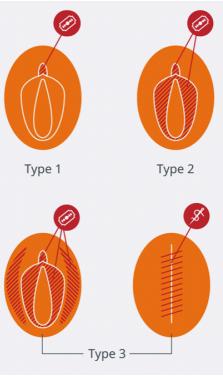

## Contraindications

- Unexplained PV bleeding
- Endometrial hyperplasia
- Breast cancer
- Uncontrolled HTN
- VTE /SLE
- Acute Liver disease
- Active angina or MI
- Pregnancy
- Stop 4 weeks before major surgery
