<b>Fluid status</b> <b>Glucose</b> <b>Hardware / lines</b> <b>Investigations</b>	<ul style="list-style-type: none"> <li><b>Urine Output and Glucose</b></li> <li><b>Beside = ECG</b> (arrythmia) <b>Urine dipstick</b> (UTI, DKA), <b>CXR</b> (pneumothorax), <b>pelvis X-ray</b>, <b>(PELVIC bleed)</b></li> <li><b>Bloods = ABG</b> (check lactates, base excess – cellular function + ischaemia), <b>IDC</b> (UO), <b>NGT</b> (decompress bowel in SBO/LBO)</li> <li><b>FAST/eFAST</b> (focussed assessment w/ sonography in trauma → <b>air/blood in pleural cavity</b> • <b>blood in abdo cavity</b> • <b>heart/liver</b>)</li> <li><b>2<sup>nd</sup> Survey</b> → ABx, tetanus prophylaxis</li> </ul>	  		

## Advanced Life Support for Adults

### What's the worst thing? = 1<sup>st</sup> dx

AAA, PE, ACS, aortic dissection, GI perforation, tension pneumothorax

➤ Always come up with 3 DDX

## AIRWAY (LEMON)

L – Look externally for characteristics known to cause difficult laryngoscopy (please circle all that apply)

**Face**

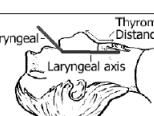

- Small jaw
- Edema
- Loose Teeth
- Facial hair
- Prominent Teeth
- Disfiguring of the jaw
- Difficult Bag/Mask Ventilation (2 person, use of airway, inability to maintain seal)

**Thorax / Abdomen**

- Pregnancy
- Massive ascites
- Bowel Obstruction
- Morbid obesity

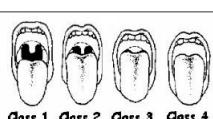

E – Evaluate the 3-3 Rule:

Mouth opening – 3 finger breadths       yes       no  
Thyro-Mental distance – 3 finger breadths       yes       no

M – Mallampati Score

Mallampati Class: \_\_\_\_\_

O – Obstruction (Is there any condition that can cause obstruction of the airway which would make laryngoscopy and ventilation difficult?)

Tumors  
 Stridor  
 Congenital Defects (Down's, Goiter, Pierre-Robin Syndrome)  
 Other obvious deformity

N – Neck mobility

Can the patient move their jaw forward?  
Can the patient fully bend / extend the head and neck?  
Is the patient in a cervical collar?

yes       no  
 yes       no  
 yes       no

## Assessment

- 1) **History:** AMPLE
- 2) **Exam:** LEMON, LOC, haemodynamics (**LEMON** = should we intubate?)
- 3) **Risk factors** for difficult airway
  - a. Trauma, High BMI
  - b. FB, Congenital tumour
  - c. Burns

## Management

- 1) Least invasive
- 2) **Basic manoeuvres** (chin lift with head tilt, or jaw thrust – better for c-spine issue)
- 3) **Add adjuncts** (Guedel, NPA, LMA)
- 4) **BVM – 2 person technique**
- 5) Advanced techniques (I+V)

## Vortex

- After best attempt at any airway method (e.g. LMA, BVM or Intubation)
- AIM = stay out of vortex
- Go for cricothyroidotomy (surgical airway)

**NB:** good sats may NOT mean a good airway

	Airway Adjuncts			Intubation		Surgical airway	
	Guedel (OPA)	NPA	LMA	I+V	Tracheotomy		
Ind	ALS	ALS	Anaesthesia Resus	1) Create airway (blockage) 2) Maintain airway (prevent) 3) Protect airway (LOC) 4) Ventilate (if lung pathology)	➤ Can't intubate, ventilate, LMA ➤ Cl = futile airway, if able to secure airway less invasively		
Mx	Angle of jaw to incisors	<ul style="list-style-type: none"> <li>➤ Nostril to ear lobe</li> <li>➤ Lubricate</li> <li>➤ Can cause blood loss (esp. patient on aspirin)</li> </ul>	<p><b>Choose correct size</b> (8mm -males, 7mm - females)</p> <ul style="list-style-type: none"> <li>➤ Lubricate</li> </ul>		<ul style="list-style-type: none"> <li>➤ Cricothyroidotomy</li> <li>➤ Tracheotomy</li> </ul>		

## New points:

- C → B → A (NOT abc)
- Cycles are 2 minutes (AVOID interruptions - COACHED)
- **CPR is the MOST IMPORTANT & PROVEN Rx**
  - 30:2 (adults), 15:2 (child) – rate is critical for sufficient preload and cardiac output
  - **Fun Fact:** cough before going into arrest - to increase afterload
- **Early defibrillation is key** – 200J (adult), 4J/kg (child)
- **AVOID XS ventilation**
- **1mg Adrenaline** (after 2<sup>nd</sup> shock) at 4mins
  - **Nb:** Lower dosage of adrenaline used in anaesthetics (25mcg, 50mcg – since potent vasoconstrictor)

## Post -resus care (stabilise and transfer care)

- Team-based approach
- 2<sup>nd</sup> survey = don't forget spine injuries
- AMPLE history + collateral (bystander, ambo)
- **Bloods** = FBC, EUC, LFT, Blood/Urine cultures,
- **Bedside** = ECG, CXR, Urine dipstick, BSL, ABG, FAST
- **Imaging** – CT brain/chest/abdo
- **Identify and treat causes**
- **Keep stable**
  - **Analgesia** (intranasal fentanyl (child/adult) or morphine (adults)
  - **Sedation** (e.g. midazolam, propofol)
  - Maintain O<sub>2</sub> at 94-98%
  - Central Temp, glucose, and CO<sub>2</sub> (capnography)

# PATIENT SAFETY AND QUALITY SCENARIOS

## ALS in ED

### SCENARIO

1. Arrest called at triage - Alert alarm at triage, everyone goes running
  - 60 year old man, walked into ED with wife, arrested in triage area
2. Arrest on arrival into resus - 68 year old man BIBA with severe SOB
  - Arrested moments after transfer onto resus bed
3. Bat call - 50 year old female, arrested at a swimming pool
  - CPR in progress with ambulance, 2 x Defib delivered so far
4. Code blue call to radiology - 42 year old female found arrested by staff in waiting bay
  - Inpatient, 20 minutes post CTPA, was in a waiting area for transfer back to ward

*Notes on ED – loud, lots of staff if day time, not enough at night, may need crowd control, team work  
Often little is known about the patient*

## ALS in Anaesthetics

### SCENARIO

1. 31 year old male for laparoscopic gastric sleeve. 110kg otherwise well
  - Induction for anaesthetic – midazolam, fentanyl, propofol, rocuronium
  - Severe bronchospasm, difficult to ventilate, BP 50/30
  - Metaraminol, intubated – no CO<sub>2</sub>, reintubated with CMAC still no CO<sub>2</sub>. 100% oxygen
  - Adrenaline boluses then infusion, CPR, hand bagged, non shockable
  - VF, shock, ECMO 45 min post arrest, output restored
  - TF to major ECMO centre

*Notes on Anaesthetics – Relatively rare, usually lots of staff depending on what hospital you are in, Patient is usually well known, full history unless urgent OT*

## ALS in ICU

### SCENARIO

1. Patient is crashing – 62 year old man been in ICU 1 week, becoming more hypoxic
  - Diagnosis of progressive interstitial lung disease. Lymphoma + other comorbidities
2. Arrest in cardiothoracic ICU – 74 year old man Day 1 post CABG
  - Urgent bedside thoracotomy performed to relieve cardiac tamponade
3. Arrest in a septic patient with severe end stage COPD – limitations of care
  - Sudden LOC, no output

*Notes on ICU – team work, lots of staff usually, Usually not a total surprise  
Usually everything is known about the patient*

## ALS on the wards

### SCENARIO

1. Arrest team – Code blue called to patient in bed space 5, Ward D
  - Code blue called by nursing staff, patient found unresponsive
2. Arrest team – 75 year old lady on the neurology ward, code blue call
  - Team present

*Notes on the ward – Relatively rare, usually lots of staff come running, can be chaotic initially  
Usually history well known to their team, often a delay in getting the full story about the patient as team usually not present and nurse may not know all the details of patient. If you are on the code blue team you will know nothing running into the room*

	Scenario #1	Scenario #2
<b>Setting</b>	Busy evening shift in a busy tertiary ED Bed block	
<b>Sx</b>	8yo F BIB mum <ul style="list-style-type: none"> <li>• Fevers at home, resolved with paracetamol</li> <li>• Mum concerned, child not right</li> <li>• No localising features. No PHx, IUTD</li> <li>• 2 siblings, some contacts unwell with coryza and fevers at school</li> </ul>	52 yo F <ul style="list-style-type: none"> <li>➢ BIBA decreased LOC (GCS 3), found on park bench</li> <li>➢ Evidence of head trauma</li> <li>➢ Likely polypharmacy involved</li> <li>➢ Patient known to ED and hospital, multiple admissions</li> <li>➢ Homeless, PHx – Bipolar, T2DM poorly controlled, HT, IHD</li> </ul>
<b>Workup</b>	<ul style="list-style-type: none"> <li>• Exam completely normal</li> <li>• Obs BTF Initially</li> <li>• Increasing RR, Increasing PR, CR prolonged on serial assessment</li> </ul>	VBG, US Bloods, CT trauma, Foot Xray
<b>DDx</b>	<ul style="list-style-type: none"> <li>• FUO – Most likely viral illness. Mother concerned</li> <li>• Obs worsening</li> <li>• Need to consider serious bacterial infection</li> </ul>	<ul style="list-style-type: none"> <li>• Polypharmacy OD – Alcohol, street fentanyl, ICE</li> <li>• Trauma / fall down stairs – Closed head injury, skull fracture ?acute ?old, 1 rib fracture, Ankle closed fracture Weber A</li> <li>• T2DM poorly controlled, BSL elevated 15-20 chronically no acute issues DKA etc</li> </ul>
<b>Mx</b>	IVC, IVAB • Admission	<ul style="list-style-type: none"> <li>• Intubated for control. ➔ <b>ICU admission required</b> ➔ BUT still needs to have particular specialty to be admitted under</li> </ul> <p><b>Who to refer?</b> NO other team wants to take her because of her problems:</p> <ul style="list-style-type: none"> <li>• <b>Neurosurgery</b> = head injury</li> <li>• <b>Gen med (trauma) or gen surg</b> (depends on what is available at hospital) -, HTN, polytrauma</li> <li>• <b>Orthopaedics</b> – if minor – can be managed as outpatient (rib and Ankle ##)</li> <li>• <b>Cardiothoracics</b></li> <li>• <b>Endocrine</b> consult but NOT admitted under – T2DM review for BSL control</li> <li>• <b>Mental health</b> – polypharmacy, bipolar, homelessness</li> </ul>
<b>Patient safety</b>	<ul style="list-style-type: none"> <li>➢ Patient looks well</li> <li>➢ Mother is concerned</li> </ul>	<ul style="list-style-type: none"> <li>• ICU admission required ➔ BUT still needs to have particular specialty to be admitted under (but who with)</li> <li>• Ensuring adequate care regardless of social context and previous healthcare experience (beneficence) ➔ recognise the deteriorating patient since high-risk complex patient</li> </ul>

# ACUTE ILLNESS AND UNDIFFERENTIATED ILLNESS

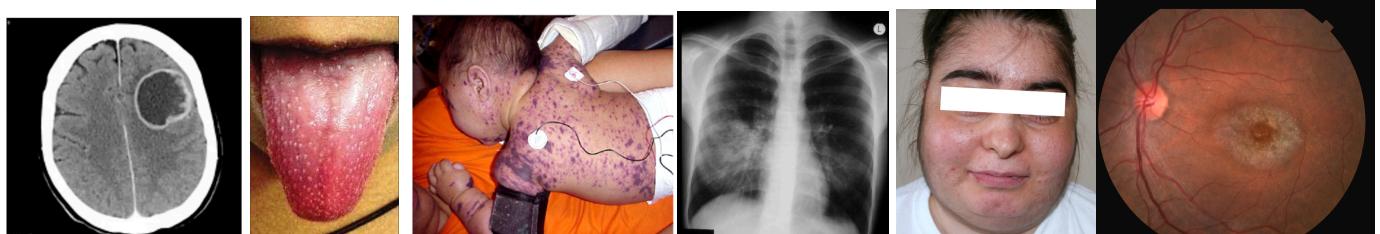

## INITIAL APPROACH

- 1) **ABCDE**
- 2) **Why are they here? – DDX** (keep broad – narrow down)
- 3) **Hx- SOCRATES**
- 4) **Systems Review essential** - Headaches → vision → hearing → CADSPIF → Cough, colds, runny nose → N/V, abdo pain, PR bleeding, altered bowel habit → PV bleeding/discharge → muscle weakness/sensation loss → systemic (UWL, fever, NS, rigors, chills) → rashes/lesions
- 5) **PMHx / PSHx / Meds** → Have they been taking **meds = partially treated – ABx?** → meningococcal septicemia
- 6) What does patient and family think?
- 7) "I don't know what exactly could be causing this but we are going to do everything we can to get to the bottom of this!"

Exam	Ix	In ED	ICU	Anaesthetics
<ol style="list-style-type: none"> <li>1. Vitals</li> <li>2. CV,</li> <li>3. Resp</li> <li>4. GI exam</li> <li>5. Neurological</li> <li>6. PR., PV and fundoscopy</li> </ol>	<b>Bedside</b> 7. ## B – BREATHING & ANAESTHETICS

### APPROACH TO RESPIRATORY DISTRESSED PATIENT

Assessment		DDx
Prepare	<ul style="list-style-type: none"> <li>Ask (patients, family, paramedics)</li> <li>Medical records, call GP practice or physician who know patient</li> </ul>	
End-of bed ( <b>always look</b> )	<ul style="list-style-type: none"> <li>Position (tripod, supine)</li> <li>Vitals (fever)</li> <li>Diaphoresis</li> <li>Pallor</li> </ul>	
Respiratory signs ( <b>always look</b> )	<ul style="list-style-type: none"> <li>O<sub>2</sub> requirement</li> <li>RR</li> <li>Accessory muscles</li> <li>Chest expansion</li> <li>Wheeze, creps</li> </ul>	
Systems	<ul style="list-style-type: none"> <li>CVS – murmurs, JVP, pulses</li> <li>Abdo – mass, tenderness, distended</li> </ul>	<p><b>Common causes of respiratory distress</b></p> <ul style="list-style-type: none"> <li>Pneumonia</li> <li>AOO (X-COPD, X-asthma, FB, anaphylaxis, bronchospasm)</li> <li>APO</li> <li>PE</li> <li>Pneumothorax (tension)</li> <li>Severe hypoxemia</li> </ul> <p><b>Other DDx (ACUTE VS CHRONIC)</b></p> <ul style="list-style-type: none"> <li><b>Heart</b> (tamponade, ACS, pericarditis, LV dysfunction, shunting, arrhythmias)</li> <li><b>NMD</b> (MG, DMD, paralyzing agent – rocuronium, phrenic nerve palsy)</li> <li><b>Chest wall</b> (obesity, scoliosis, pectus excavatum)</li> <li><b>CNS depression</b> (narcotics, stroke, SCI)</li> <li><b>Poisons / toxins</b></li> </ul>

### Risk Stratifying Tool for pneumonia

	Use	Outcome
CURB-65	<b>Predictor of 30 day mortality</b>	<ul style="list-style-type: none"> <li>Confusion (AMTS &lt;=8), Urea &gt;7, RR &gt;= 30, BP &lt;90/ &lt;-60), Age &gt;=65</li> <li>0-1 (outpatient), 2 (hospital), 3 (ICU)</li> </ul>
Pneumonia severity index	Predictor of short-term mortality (higher discriminatory power than CURB-65)	<ul style="list-style-type: none"> <li><b>20 variables</b> (demographics, comorbidities, physical exam, vitals)</li> <li>Investigations also needed (BSL, ABG, CXR)</li> </ul>
SMARTCOP	<b>Need for MV or vasopressor</b>	<ul style="list-style-type: none"> <li><b>SBP &lt;90</b>, <b>Multilobar CXR</b>, <b>Albumin &lt;35</b>, <b>RR &gt; 25</b>, <b>Tachy &gt;125</b></li> <li><b>Confusion, Oxygen pO<sub>2</sub> &lt; 70mm Hg, pH &lt; 7.35, Sats &lt;94%</b></li> </ul>
PERC rule	<b>Exclude PE</b>	•

### INDICATIONS FOR AN ABG!

	Why	What	Common Indications
<b>Rapid Results</b>		<ul style="list-style-type: none"> <li>Haemoglobin</li> <li>Sodium</li> <li>Potassium</li> </ul>	<ul style="list-style-type: none"> <li>Haematemesis</li> <li>Unexplained haemodynamic instability</li> <li>Life threatening hyperkalaemia</li> <li>Severe hyponatraemia</li> </ul>
<b>Assess Respiratory status</b>		<ul style="list-style-type: none"> <li>pO<sub>2</sub></li> <li>pCO<sub>2</sub></li> </ul>	<ul style="list-style-type: none"> <li>Technical issues</li> <li>Abnormal Hb</li> <li>Severity assessment</li> <li>NIV / Intubation</li> <li>Ventilator adjustment</li> <li>Extubation</li> </ul>
<b>Assess Acid-base status</b>		<ul style="list-style-type: none"> <li>HCO<sub>3</sub> / B.E</li> <li>pH</li> </ul>	<ul style="list-style-type: none"> <li>DKA</li> <li>Renal failure</li> <li>Overdose</li> <li>Assess degree of compensation</li> </ul>
<b>Specific tests</b>		<ul style="list-style-type: none"> <li>Lactate</li> <li>Ionised Calcium</li> </ul>	<ul style="list-style-type: none"> <li>Shock</li> <li>Type B</li> <li>Massive transfusion</li> <li>Rhabdomyolysis</li> </ul>

### DETERMINE DIAGNOSIS – INVESTIGATIONS

Bloods	<ul style="list-style-type: none"> <li><b>FBC</b> (Hb, WCC, plts, Hct)</li> <li><b>EUC</b> (Na, K, eGFR, Cr, Urea)</li> <li><b>LFT</b> (albumin)</li> <li><b>Coags</b></li> <li><b>D-dimer</b></li> <li><b>CRP</b></li> </ul>	<p><b>Specific Heart Ix</b></p> <ul style="list-style-type: none"> <li>➤ Troponin (beware ONLY raised after 2 hrs)</li> <li>➤ BNP</li> <li>➤ ECG</li> <li>➤ TTE / TOE</li> </ul>
	<ul style="list-style-type: none"> <li><b>Blood culture</b></li> <li><b>Sputum</b> (? Induced vs tracheal aspirate vs bronchoscopy)</li> <li><b>Viral swab</b></li> <li><b>Urine</b></li> </ul> <p><b>Beware of contaminants</b></p> <ul style="list-style-type: none"> <li>Coag negative staph in blood</li> <li>Mouth flora or candida in sputum</li> </ul>	
Test	<b>Advantages</b>	<b>Limitations</b>
	<ul style="list-style-type: none"> <li>Rapidly available</li> <li>Venous ok if pCO<sub>2</sub> normal)</li> <li>Measure of severity</li> <li>"Occult" hypercarbia</li> </ul>	<ul style="list-style-type: none"> <li>Does not frequently guide initial management</li> <li>Painful / Stressful for patient</li> </ul>
CXR	<ul style="list-style-type: none"> <li>Rapidly available</li> <li>Cornerstone for diagnosis (<b>must compared with previous CXR</b>)</li> </ul>	<ul style="list-style-type: none"> <li>Sensitivity and specificity Inter-interpreter variability</li> </ul>
CT	<ul style="list-style-type: none"> <li>Pulmonary Emboli</li> <li>Cancer</li> <li>More sensitive and specific for other causes</li> </ul>	<ul style="list-style-type: none"> <li>Patient needs to lie flat (bad if haem compromised)</li> <li>Contrast allergy or impaired AKI (DM, CKD)</li> <li>Radiation load</li> <li>Resource burden</li> </ul>
US	<ul style="list-style-type: none"> <li>Rapidly available</li> <li>Concurrent assessment of heart and lungs</li> <li>Broad division (Airways disease, Interstitial, Pleural)</li> </ul>	<ul style="list-style-type: none"> <li>Appropriate training required</li> <li>Incorrect interpretation</li> </ul>
Bronchoscopy	<ul style="list-style-type: none"> <li>More sensitive for less common pathology</li> <li>More likely to tailor ABx</li> <li>Possible therapeutic benefit</li> </ul>	<ul style="list-style-type: none"> <li>Well enough to tolerate or be intubated</li> <li>Complications (hypoxia, aspiration, pneumothorax)</li> </ul>

# RESPIRATORY CARE MX – (1) Supportive Care + RESUS → (2) ABCDEFG → (3) Therapy Goals

<ol style="list-style-type: none"> <li>Supportive care and Rx symptoms (SOB, chest pain, vomiting) → FiO<sub>2</sub>, analgesia, anti-emetics</li> <li>Ensure adequate oxygenation &amp; ventilation (CO<sub>2</sub> elimination)             <ol style="list-style-type: none"> <li>What's the goal? - PaCO<sub>2</sub>, pH or clinical end-point</li> <li>Methods improving ventilation? → control FIO<sub>2</sub>, NIPPV, intubation</li> <li>Correct reversible pathology – bronchospasm, sedative toxicity</li> </ol> </li> <li>Optimise haemodynamics + fluid status             <ol style="list-style-type: none"> <li>HTN (High LV afterload – APO) → SL/IV GTN</li> <li>HypoTN? (shock – hypovolaemic, obstructive) → IVF</li> <li>Arrhythmias (Atrial tachycardia esp. in acute resp. failure) → rate and rhythm control</li> </ol> </li> </ol>	<b>Goals of therapy</b> <ol style="list-style-type: none"> <li>Burden on patients/family             <ol style="list-style-type: none"> <li>uncomfortable support <b>NOT</b> treatment</li> <li>prevents patients from communicating</li> </ol> </li> <li>Prognosis in those with resp. failure with advanced disease –             <ol style="list-style-type: none"> <li>burden of care,</li> <li>likelihood of survival</li> <li>perceived QoL</li> </ol> </li> </ol>

	Minimally invasive	Flow Rate	FiO <sub>2</sub> (%)	Indication for use			
	<b>Nasal Cannula/Prongs</b>	1-4 L/min (turned up in ED)	25-35	Minimal resp. distress (~90%) Inverse rule (FiO <sub>2</sub> $\propto$ 1/flow) → Lower FiO <sub>2</sub> for greater WOB Less claustrophobic, low cost, can eat and speak			
	<b>Simple Face Mask</b>	5-10 L/min	40-60	Moderately hypoxic Risk of CO <sub>2</sub> retention			
	<b>Venturi Mask</b> blue – white- orange – yel -red-green (2 -----4 -----6 -----8 -----10 -----15)	2-10 L/min (adaptor)	24-60% (fixed)	COPD patients (i.e. avoid CO <sub>2</sub> retention) = loss of hypoxic drive to breath Transition to non-rebreathing mask in emergency or if patient is not well			
	<b>Non-Rebreathing Mask</b> *Reservoir bag MUST be inflated + tight fit needed	15 L/min	> 60%	Oxygen reservoir to give higher FiO <sub>2</sub> with adequate ventilation <b>Mainly for</b> <ul style="list-style-type: none"> <li>Post-cardiac or respiratory arrest.</li> <li>Severely hypoxic patient</li> </ul>			
	<b>Hi Flow Nasal Cannula</b> "humidified O <sub>2</sub> delivery under pressure"	≤60 L/min	Up to 100% (hard to titrate)	Low level prep → applied nasally or via tracheostomy Humidifier replicates humidifying effect of nose Matches inspiratory flow rate even with increased WOB Aims to reduce subjective WOB and SOB			
	<b>Bag-Valve- Mask Resuscitator</b>	15 L/min	>0.8	<b>Key principles:</b> <ul style="list-style-type: none"> <li>Almost always Need adjunct → nasopharyngeal or oropharyngeal (Guedel) airway or BOTH</li> <li>optimize patient position (inc. bed height)</li> </ul>	<b>Difficult BVM causes = BONES</b> <ol style="list-style-type: none"> <li>Beard = impedes a good seal</li> <li>Obese</li> <li>No teeth = loss of facial architecture – (but easier intubation)</li> <li>Elderly</li> <li>Sleep Apnea / Snoring</li> </ol>	<b>Relative CI</b> <ul style="list-style-type: none"> <li>Facial trauma</li> <li>Recent surgery (URTI, upper GIT)</li> <li>Reduced LOC</li> <li>Aspiration risk (obtunded pt)</li> <li>Pneumothorax</li> <li>Signs of RV strain</li> </ul>	
	<b>Non-invasive PPV (CPAP, BPAP)</b>	Adjustable L/min	Fixed FiO <sub>2</sub> (up to 100%)	<b>CPAP</b> Constant pressure → alveolar recruit ➤ PREVENT airway collapse ➤ ↑↑ atelectasis + alveolar Vent. ➤ Reduces LV afterload	<b>BIPAP</b> IPAP (air forced into lungs) + expiratory PEEP (prevent collapse) ➤ Reduces inspiratory effort ➤ Increased tidal volume and CO <sub>2</sub> clearance		
	<b>Mechanical ventilation OR Tracheostomy (emergency)</b>	Adjustable Control FiO <sub>2</sub> , RR, TV, Peak flow rate, PEEP	100%	• Endo-tracheal tube = <b>definitive airway</b> to maintain airway patency • LMA (laryngeal mask airway) = <b>non-definitive airway</b> <b>Dynamic manoeuvres (e.g. prone position)</b> • reduces lung compression by adjacent organs • improves ventilation and perfusion PLUS improves oxygenation and secretion clearance			

\*\*\*\*\* **Fraction of Inspired Oxygen (FiO<sub>2</sub>) concentration ≈ (Flow Rate x 4) + 21 (FiO<sub>2</sub> in room air)** \*\*\*\*\*

	WHAT IS IT?	INDICATIONS	SIDE EFFECTS
Anti-microbials	<b>Infection</b>	<b>Organisms</b>	<b>Anti-microbial</b>
	<b>CAP</b>	Streptococcus, Haemophilus, Moraxella	Ceftriaxone
	<b>Atypical</b>	Mycoplasma, Legionella, Chlamydia	Azithromycin
	<b>Hospital Acquired</b>	<ul style="list-style-type: none"> <li>Resistant Gram-ve (psuiedomonas)</li> <li>MSSA vs MRSA</li> </ul>	<b>Tazocin</b> Vancomycin
	<b>Chronic lung disease</b>	Pseudomonas	<b>Tazocin</b>
	<b>Immunocompromised</b>	<ul style="list-style-type: none"> <li>Neutropenic</li> <li>PJP</li> <li>Fungal (e.g. aspergillosis)</li> <li>Viral reactivation (CMV)</li> </ul>	<b>Tazocin</b> & gentamicin Bactrim Antifungal Valganciclovir
	<b>Viral</b>	Influenza	Oseltamivir

# ABG INTERPRETATION

## How to interpret ABG/VBG?

- Check pt details and ALWAYS CHECK OTHER RESULTS (Hb, lactate, BSL, K)
  - Circle HIGH and LOW values
- Is it venous or arterial? → Do I need ABG or VBG?
  - If ventilating/sepsis = **need ABG**
  - If chronic lung disease/DKA = **VBG + SaO<sub>2</sub>**
  - DO NOT DO ABG ON ROOM AIR IF PATIENT IS HYPOXIC**
- If resp. acidosis → check **A-a gradient** (diffusion issue?).
  - High A-a = lung issue (NOT CNS)
- If **NO resp. or metabolic cause** → check **Base Excess** (-2.5 to +2.5)
  - < -2 = acidosis
  - > 2 = alkalois
  - Is there another cause of the acidemia or alkalemia?
- If **metabolic acidosis** → check **Anion Gap** to determine if:
  - (1) **intrinsic loss** (i.e. renal, DKA, Lactate) or
  - (2) **extrinsic acid** (e.g. methanol, anti-freeze)
- Respect buffering (HCO<sub>3</sub> may be normal) → ECF (HCO<sub>3</sub>) Blood (Hb), ICF (PO<sub>4</sub>) buffering
- Summarise findings

This patient is a \_\_\_\_\_aemic Due to a primary \_\_\_\_\_osis With partial/full \_\_\_\_\_ compensation

## Severity of T1RF: P:F ratio or S:F ratio [ONLY from ABG]

$$P:F \text{ ratio} = \frac{PaO_2}{FiO_2} \text{ or } \frac{satsO_2}{FiO_2}$$

In ARDS = <300 (mild), <200 (moderate), < 100 (severe)

## A-a gradient (difference b/w O<sub>2</sub> conc. in alveoli and arterial system)

$$A-a \text{ gradient} = P_{AO_2} - PaO_2 \cong \frac{Age}{4} + 4$$

$$P_{AO_2} = FiO_2 \times (P_B - P_{H_2O}) - \frac{PaCO_2}{RQ}$$

Cause for hypoxia	A-a gradient	Corrected with high FiO <sub>2</sub> ?	Causes
Low FiO <sub>2</sub>	Normal	Yes	High altitude, hypoxic gas mixture
Hypoventilation	Normal	Yes	Residual anesthetic, muscle relaxants
Diffusion	Elevated	Yes	Interstitial lung disease
V/Q mismatch	Elevated	Yes	Mucus plug, pulm embolism, COPD
Shunt	Elevated	No	Atelectasis, ARDS

## First formula:

$$\text{Anion gap} = Na^+ + K^+ - (Cl^- + HCO_3^-)$$

normal:

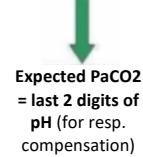

8 - 12 mEq/L (if without potassium)

12 - 16 mEq/L (if potassium is given)

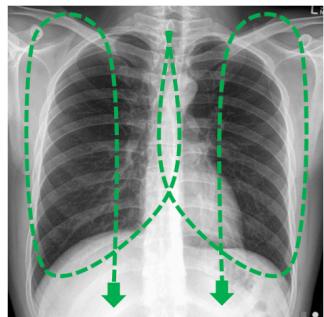

Is there an anion that is NOT measured? E.g. albumin

Metabolic acidosis = uses up HCO<sub>3</sub> → Low HCO<sub>3</sub> on ABG/VBG

	pH	pCO <sub>2</sub>	HCO <sub>3</sub> <sup>-</sup>	Cause
<b>Normal</b>	7.35-7.45	35-45mmHg	22-26 mmHg	
<b>Resp. acidosis</b>				<p><b>Normal (ACUTE)</b> mainly from intracellular Hb, PO<sub>4</sub> buffering</p> <p><b>↑ (CHRONIC)</b> ↑↑ 1mM HCO<sub>3</sub> = ↑↑ 10mmHg PaCO<sub>2</sub> (occurs after 24 hrs w/ max response at 3-4 days)</p>
<b>Resp. alkalosis</b>				<p><b>Normal (ACUTE)</b> mainly from intracellular Hb, PO<sub>4</sub> buffering (within 10mins - max response at 6 hrs)</p> <p><b>↓ (chronic)</b> ↓↓ 5mM HCO<sub>3</sub> = ↓↓ 10mmHg PaCO<sub>2</sub> (from 6 hrs to 2-3 days)</p>
<b>Metabolic. Acidosis (L TKR)</b>				<p><b>High anion gap metabolic acidosis (HAGMA)</b></p> <p><b>Toxins → MUDPILES</b></p> <ol style="list-style-type: none"> <li><b>Lactate</b> <ul style="list-style-type: none"> <li>IV adrenaline</li> <li>Metformin</li> </ul> </li> <li><b>Urate or XS H<sup>+</sup> (RENAL FAILURE)</b> <ul style="list-style-type: none"> <li>XS PO<sub>4</sub>, sulphate, Hippurate</li> <li>Type 1 RTA</li> <li>rhabdomyolysis</li> </ul> </li> <li><b>Ketones</b> <ul style="list-style-type: none"> <li>DKA (T1DM, SU, Insulin)</li> <li>Starvation state (AN)</li> <li>Alcohol</li> </ul> </li> <li><b>Alcohol (toxins)</b> <ul style="list-style-type: none"> <li>Ethylene glycol (anti-freeze) = osmolar gap</li> <li>Pyroglutamic acid = XS N-acetyl cysteine</li> </ul> </li> </ol>
<b>Metabolic. alkalosis</b>				<p><b>Above Stomach loss</b> = VOMITING, NGT/NPA aspiration</p> <p><b>Exogenous HCO<sub>3</sub><sup>-</sup></b> = Overcorrection IV or Milk alkali syndrome (XS Mylanta - antacids)</p> <p><b>K<sup>+</sup> depletion</b> → Cushing, diuretic +/- diarrhoea</p> <p><b>HyperAldo</b> → Conn's, cirrhosis, HF, loop and thiazides</p>
<b>Mixed acid base</b>	<ul style="list-style-type: none"> <li>Mixed metabolic acidosis/alkalosis</li> <li>Mixed metabolic and respiratory</li> </ul>		<ul style="list-style-type: none"> <li>Lactic acidosis/DKA with vomiting (met acid + alkalosis)</li> <li>Salicylate poisoning (met acid + resp. alkalosis)</li> </ul>	

## CXR Checklist [PA = good, AP = crAP! ]

First pass		Review areas	
Trachea			
Mediastinum			
Cardiac borders			Pneumomediastinum
Costophrenic angles			Retrocardiac
Soft tissues			Apices
Bones			Below diaphragm
Below diaphragms			

### 1. Intro (Pt Name, DOB, date, projection, quality → RIPE)

- a. **Rotation** – medial border of clavicle heads equidistant to spinous process
- b. **Inspiration** – see 6 anterior ribs, MCL
- c. **Position** – supine, erect, lateral, decubitus
- d. **Over-exposure (black)**, under exposure (white) – VERTEBRAE JUST VISIBLE BEHIND HEART

### 2. AIRWAY- tracheal/mediastinal deviation (? patient rotation) OR obvious masses

### 3. BREATHING – lung fields, pleura, hilar region

<ul style="list-style-type: none"> <li>a. Air (?pneumothorax, emphysema)</li> <li>b. Fluid / meniscus sign (? Effusion)</li> <li>c. Consolidation (?infection)</li> <li>d. Lobar collapse</li> <li>e. Lesions (e.g. malignancy, abscess)</li> </ul>	<p><b>Pleura</b></p> <ul style="list-style-type: none"> <li>• Pleural plaques (?asbestosis)</li> <li>• Calcification</li> </ul> <p><b>Hilum</b></p> <ul style="list-style-type: none"> <li>• Bilateral enlargement (?sarcoid)</li> </ul>
---	--

### 4. BONES/BREAST SHADOW

- a. Obvious fractures- clavicles, flail ribs
- b. Scoliosis, lytic lesions
- c. METs
- d. Pectus excavatum

### 5. CIRCULATION

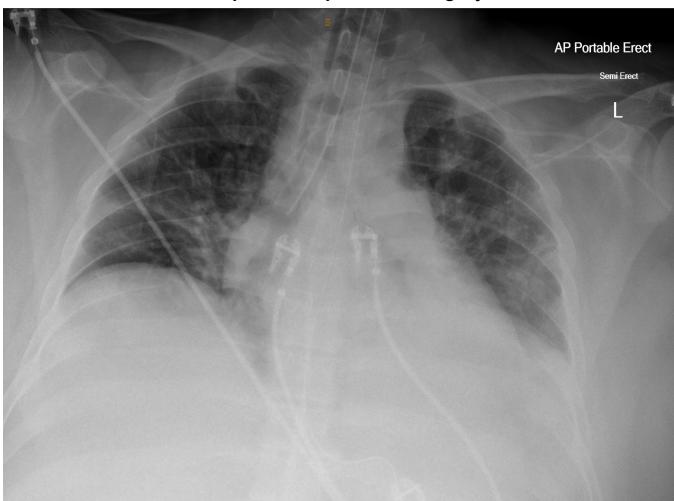

- a. **Cardiomegaly 2° to HF** (> 50% cardiothoracic ratio - adults, > 65% infants)
- b. Heart border (R = RA, L = LV)
- c. Aortic knuckle should be visible
- d. Mediastinal width (>8cm = **aortic dissection**)

### 6. DIAPHRAGM

- a. **high riding** – phrenic nerve palsy, DMD, MND, MG
- b. **Flattening** – obstructive lung disease (emphysema, asthma)
- c. Air under diaphragm – pneumoperitoneum (abdo perforation)
- d. Blunting costophrenic angles – pleural effusion

### 7. EXTRA DEVICES

- a. **CENTRAL LINE** = internal jugular vein → CVS and cavo-atrial junction
- b. **NGT** =below diaphragm at tip of stomach
- c. **PICC line** = peripheral → cavo-atrial junction
- d. **Portocath** = Subclavian vein → cavo-atrial junction
- e. **ETT** = mouth →3-5cm above carina (level of aortic knuckle)
- f. **Chest drain** = in pleural space
- g. **ECG electrodes**
- h. **Sternal wires (previous open heart surgery)**

### Key knowledge:

- **BLACK**: air > fat > soft tissue > bone **WHITE**
- Describing abnormality:
  - **Density** (relative to what?, uniform vs patchy?)
  - **Left vs Right** (Which zone?)
  - **Anatomical position** (pleura vs parenchyma)
  - **Size + borders**
- **MOBILE CXR** → LARGE HEART + SEVERE ROTATION

### Summarise

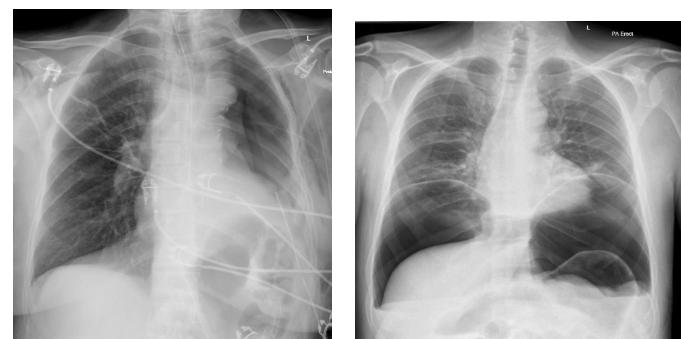

- This is an erect PA CXR of \_\_\_\_ showing \_\_\_\_ To complete my analysis, I would examine previous films and ascertain the clinical hx
- My ddx \_\_\_\_
- Investigations I would order \_\_\_\_

## Common presentations/DDx

 <b>Opacification</b> (NOT just infection)	 <b>Diffuse alveolar shadowing</b>

## C- CIRCULATION / SHOCK

### Diagnosis of shock

Shock is a cellular state of hypoperfusion

Hx	<ul style="list-style-type: none"> <li><b>Collapse, syncope</b></li> <li><b>Signs of End-organ hypoperfusion</b> (chest pain, confusion, abdo pain, oliguria)</li> <li><b>Compensatory signs</b> – WoB, kussmaul, polydipsia</li> </ul>				
Exam	<ul style="list-style-type: none"> <li><b>Witals</b> → ↑RR, ↑HR, ↓BP, Sats, Temp</li> <li><b>Warm</b> - Capillary refill time, pallor, diaphoresis</li> <li><b>Wet /dry (fluid status)</b> – oliguria, MM, bibasal crackles, oedema</li> <li><b>With it</b> - GCS/Confusion / Drowsiness</li> </ul>				
Tests	<ul style="list-style-type: none"> <li><b>Wactate</b> - Lactate (VBG) – good to monitor to response of treatments</li> <li><b>CRP</b></li> </ul>				
Non-invasive tests	<table border="1"> <tr> <th>Semi-invasive tests</th><th>Invasive tests</th></tr> <tr> <td> <ul style="list-style-type: none"> <li>Existing monitoring – Sats, ECG</li> <li>CXR</li> <li>TTE</li> <li>Impedance</li> </ul> </td><td> <ul style="list-style-type: none"> <li>Arterial Line</li> <li>TOE</li> <li>Oesophageal doppler</li> <li>Swann-Ganz – right heart thermodilution</li> <li>CVO<sub>2</sub>/MVO<sub>2</sub></li> <li>PICCO – trans-pulmonary thermodilution</li> </ul> </td></tr> </table>	Semi-invasive tests	Invasive tests	<ul style="list-style-type: none"> <li>Existing monitoring – Sats, ECG</li> <li>CXR</li> <li>TTE</li> <li>Impedance</li> </ul>	<ul style="list-style-type: none"> <li>Arterial Line</li> <li>TOE</li> <li>Oesophageal doppler</li> <li>Swann-Ganz – right heart thermodilution</li> <li>CVO<sub>2</sub>/MVO<sub>2</sub></li> <li>PICCO – trans-pulmonary thermodilution</li> </ul>
Semi-invasive tests	Invasive tests				
<ul style="list-style-type: none"> <li>Existing monitoring – Sats, ECG</li> <li>CXR</li> <li>TTE</li> <li>Impedance</li> </ul>	<ul style="list-style-type: none"> <li>Arterial Line</li> <li>TOE</li> <li>Oesophageal doppler</li> <li>Swann-Ganz – right heart thermodilution</li> <li>CVO<sub>2</sub>/MVO<sub>2</sub></li> <li>PICCO – trans-pulmonary thermodilution</li> </ul>				

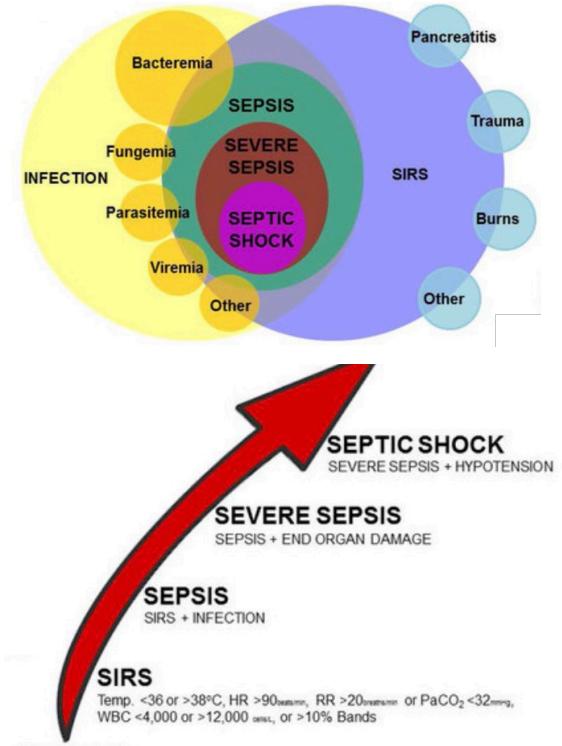

### General Acute Mx of shock

- 1) Triage - CAT1-5
- 2) Transfer to appropriate area (e.g resus, bed)

A	Unconscious / Procedures
B	High work of breathing → sats, RR, FiO <sub>2</sub>
C	<p><b>Arrhythmias / Cold or warm peripheries</b></p> <ul style="list-style-type: none"> <li>➤ ECG</li> <li>➤ IV Access x2 → Bloods – FBC, EUC, LFT, troponin, VBG, culture M/C/S</li> <li>➤ USS – FAST</li> <li>➤ UA</li> </ul> <p><b>Optimize hemodynamics</b></p> <ol style="list-style-type: none"> <li>1. <b>Check if fluid responsive 1<sup>st</sup></b> <ol style="list-style-type: none"> <li>a. Straight leg raise, calf pump or lie supine to increase VR</li> </ol> </li> <li>2. <b>Restore intravascular volume "like for like"</b> <ol style="list-style-type: none"> <li>a. IVF crystalloids vs colloids (alternate each day – reduce acidosis)</li> <li>b. Listen to chest for APO – <u>bibasal crackles</u> → consider reducing fluids and adding FiO<sub>2</sub></li> </ol> </li> <li>3. <b>Maintain BP with vasopressors MAINLY</b> → target MAP &gt; 65, SBP &gt; 90</li> <li>4. <b>Assess and optimize CO</b></li> <li>5. <b>Decide when to stop</b> (e.g. not working or APO) → DO CXR!!</li> </ol>
D	Delirium – 4AT
E	Bleeding, Melaena, Hypothermia – check foo rashes
G	Hypoglycemia, abdo exam,

### Types of shock + Mx

SIRS	<p><b>(at least 2 of these to meet criteria)</b></p> <ol style="list-style-type: none"> <li>1. Body temp &gt;38°C or &lt;36°C,</li> <li>2. HR &gt; 90/min</li> <li>3. RR &gt; 20/min or PaCO<sub>2</sub> &lt; 32 mmHg</li> <li>4. WCC &gt; 12.0 x 10<sup>9</sup>/L or &lt; 4.0 x 10<sup>9</sup>/L</li> </ol>	<p><b>Pathophysiology:</b></p> <ol style="list-style-type: none"> <li>1) Raised pro-inflammatory mediators (IL-1,6 and TNF-<math>\alpha</math> from macrophages activates neutrophils, platelets and endothelial cells) → DIC + increased vascular permeability</li> <li>2) Raised acute phase proteins (buy time)</li> <li>3) HypoTN, hypoperfusion, hypoxia</li> </ol>
Sepsis	<ul style="list-style-type: none"> <li>Life-threatening organ dysfunction caused by a dysregulated host response to infection</li> </ul>	
Severe Sepsis	<ul style="list-style-type: none"> <li>Sepsis + evidence of organ dysfunction (e.g. hypoxia, oliguria, AKI, Coag dysfn, hypoTN, raised lactate &gt; 2 mM, thrombocytopenia)</li> </ul>	
Septic Shock	<ul style="list-style-type: none"> <li>Sepsis + arterial BP drop causing organ hypo-perfusion</li> <li>➤ Systolic BP &lt; 90 (DESPITE adequate fluid resus)</li> <li>➤ Raised lactate &gt; 4 mM</li> </ul>	
Septicaemia	<ul style="list-style-type: none"> <li>Bacteria enters bloodstream triggering sepsis (e.g. meningococcaemia)</li> </ul>	
Bacteraemia	<ul style="list-style-type: none"> <li>Bacteria in the bloodstream. May or may not cause SIRS or sepsis.</li> </ul>	
Risk factors	<ul style="list-style-type: none"> <li>Extremes of age (&lt;1 yo or &gt; 75 yo)</li> <li>Chronic conditions (e.g. COPD and diabetes)</li> <li>Chemo, immunosuppressants and steroids</li> <li>Recent surgery, trauma or burns</li> <li>Pregnancy or peripartum</li> <li>Indwelling devices (e.g. catheters and central lines)</li> </ul>	

**qSOFA score**

**IF SCORE > 1 THEN INVESTIGATE FOR PRESENCE OF ORGAN DYSFUNCTION AND INCREASE FREQUENCY OF MONITORING**

**Sequential Organ Failure Assessment** → measure mortality in ICU

- Quick SOFA (≥ 2 of the following = **HIGH** Mortality)
- GCS < 15, RR >= 22, sBP < 100
- Febrile
- Reduced UO- cloudy urine

## Define sepsis and specific definitions within sepsis

Sepsis Risk factors	Clinical signs	Management (Ix)																		
<ul style="list-style-type: none"> <li>Male</li> <li>Diabetes (risk factor for any disease)</li> <li>Race</li> <li>Co-morbidities</li> <li><b>Immunosuppressed</b> – post-transplant, immunosuppressants, HIV,</li> <li>Genetics</li> <li>Age</li> </ul> <p><b>Sepsis Pathway:</b></p> <ol style="list-style-type: none"> <li>1. Dx early (check vitals)</li> <li>2. Airway + <math>\text{FiO}_2</math></li> <li>3. IV access – blood culture + baselines (FBC, EUC, LFT, CRP, BSL, X-MATCH, COAGS) + lactate (VBG)</li> <li>4. Early Abx (within 1 hr)</li> <li>5. IV fluid bolus (shock) – 250-500mL NS/Hartmann/plasmolyte</li> <li>6. Find source (examine top-toe) → Dx samples (if time) - pus, sputum, urine</li> <li>7. Restore haemodynamics (fluid balance + UO monitor + vasopressors)</li> </ol>	<div style="display: flex; justify-content: space-around;"> <div style="text-align: center;"> <p>Rigors</p> </div> <div style="text-align: center;"> <p>Warm and then cool peripheries</p> </div> <div style="text-align: center;"> <p>Poor pulses</p> </div> </div> <div style="display: flex; justify-content: space-around; margin-top: 10px;"> <div style="text-align: center;"> <p>Oliguria or anuria</p> </div> <div style="text-align: center;"> <p>Altered mental states</p> </div> <div style="text-align: center;"> <p>Focal signs</p> <ul style="list-style-type: none"> <li>Pneumonia</li> <li>Acute abdomen</li> <li>PIVC infection</li> <li>Cellulitis</li> </ul> </div> </div> <div style="margin-top: 20px;"> <p><b>Peripheral vascular effects</b></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th colspan="2" style="text-align: center;">Direct inotropic effects</th> </tr> <tr> <th style="text-align: center;">YES</th> <th style="text-align: center;">NO</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">Inoconstrictors</td> <td style="text-align: center;">Vasoconstrictors</td> </tr> <tr> <td style="text-align: center;">Norepinephrine Epinephrine Dopamine</td> <td style="text-align: center;">Phenylephrine Vasopressin</td> </tr> <tr> <td style="text-align: center;">Subset I</td> <td style="text-align: center;">Subset II</td> </tr> </tbody> </table>   <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th colspan="2" style="text-align: center;">Vasodilation</th> </tr> <tr> <th style="text-align: center;">Inodilators</th> <th style="text-align: center;">Vasodilators</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">Dobutamine Milrinone</td> <td style="text-align: center;">Nitroglycerin Nitroprusside Nesiritide</td> </tr> <tr> <td style="text-align: center;">Subset III</td> <td style="text-align: center;">Subset IV</td> </tr> </tbody> </table> <p style="text-align: center; margin-top: 10px;">INOTROPES</p> <p style="text-align: center; margin-top: 10px;">Subset categories vasodilatory agents by presence or absence of inotropic effects and effects on vasculature.</p> </div>	Direct inotropic effects		YES	NO	Inoconstrictors	Vasoconstrictors	Norepinephrine Epinephrine Dopamine	Phenylephrine Vasopressin	Subset I	Subset II	Vasodilation		Inodilators	Vasodilators	Dobutamine Milrinone	Nitroglycerin Nitroprusside Nesiritide	Subset III	Subset IV	<p><b>MEDICAL EMERGENCY</b></p> <p>Initiate bundle upon recognition of sepsis/septic shock. ### Case 1 32 y BIBA + palpitations (sudden onset)

- Straight to Resus
  - BP 120/70
  - PR 180 regular
  - RR20
  - Sats99%RA
  - Afebrile
  - Glucose 6.2
- Has had similar episodes all self resolved
- All other examination normal

### Case 2

- Straight to Resus
  - BP 80/60
  - PR 180 regular
  - RR35
  - Sats99%RA
  - Temp 39.6
  - Glucose normal
- Dry skin,
- Warm and mottled peripheries** –
- Becoming drowsy and confused
- Looks sick

### Case 3

- Straight to Resus
  - BP 180/120
  - PR 180 regular
  - RR35
  - Sats99%RA
  - Temp 40.2
- Sweaty
- Tremulous
- Confused

### SVT

**Causes** hypovolemic shock → reduced diastolic filling time

- low EDV → low SV → low CO
- reduced coronary artery filling = STEMI

### Septic shock (febrile)

Possible underlying SVT?

### Thyroid storm (high output state)

- Confused & increased demand (everything elevated)
- ↓ BP = septic shock

### SHOCK QUESTIONS

A 19-year-old male is brought to the hospital after sustaining an abdominal injury while playing rugby. He is complaining of left upper abdominal pain and has some bruising over the same area. His pulse is 140/min and his BP is 100/82mmhg.

A 82 year-old male is brought to the hospital after a high speed mva. He has no pain. His pulse is 55/min and his bp is 100/82mmhg.

52 year old lady with intermit mild chest pain radiating to her right arm and back. Onset 1 hour before presenting to the emergency department. Came to ed because it "just didn't feel right"

- Obs – pr 105, bp 110/60
- Afebrile
- Rr 20 sats 95% ra
- Glucose normal
- Cool peripheries

24 year old. Presenting with period pain.

- Obs – pr 105, bp 125/80
- Afebrile
- Rr 20 sats 97% ra
- Glucose normal
- Cool peripheries

What is the type of shock?

**Hypovolaemic – splenic rupture?**

#### What is the type of shock?

- 1<sup>st</sup> Hypovolaemic – insufficient information – likely on BB due to his age causes **false Hypotension**
- 2<sup>nd</sup> Neurogenic (distributive) – cannot assume immediately

#### Cardiogenic shock (post-MI)

- Obstructive – PE, pneumothorax
- PANIC ATTACK?

#### Investigations

- Serum cardiac markers – troponin, CK-MB ECG – sinus tachycardia (no ST elevation) → most likely PE
- CXR - pneumothorax
- CTPA – PE (+ d-dimer, V/Q perfusion)

#### Hypovolaemic shock

- Ruptured ectopic pregnancy
- Look well then rapidly deteriorate

#### Ix:

B-HCG, FBC, EUC, ESR/CRP, BSL

### SESPIS QUESTIONS

#### Case 2

A 62 Year Old Female Presents With Fever Of Unknown Origin.  
BP 100/60  
PR 120.  
RR 20  
MILDLY CONFUSED, GCS 14.

**WHAT IS HER SHOCK INDEX**  
1.2

#### Case 3

26 year old, personal trainer, lover of sandals  
BAT call – collapse at home, febrile, confused

- BP 100/70
- PR130
- Fever to 39.8
- Sats 89% RA
- Warm, dry peripheries

**History from girlfriend Meg** → Recent arrow to left foot, in between sandal straps

#### Management of case 3

<p>Comp.?</p>	<p>Rx</p>	<ul style="list-style-type: none"> <li>Sepsis, severe sepsis</li> <li>Multorgan dysfunction – ARDS, Mental status</li> <li>Source – foreign body</li> </ul> <ol style="list-style-type: none"> <li>Airway - nonrebreather (inc. COPD) – low sats + SOB</li> <li>Antibiotics – ceftriaxone (check guidelines – e.g. flu)</li> <li>IV fluids – Hartman's → NA</li> <li>Pressors – Noradrenaline Source control - steroids?</li> </ol>

5) **Cervical shock** – Missed M/C → HypoTN in high -B-HCG women → need to remove POC (Avoid XS fluid resus)

6) **High Output Heart Failure shock** (XS Vasodilatation + XS O<sub>2</sub> demand → chronic ↑CO → chronic ↑preload + ↓SVR)

- beri-beri (systemic vasodilatation),
- thyroid storm (thyrotoxicosis),

- obesity
- Myeloproliferative disorder

- severe, anaemia
- Paget's disease

- Cirrhosis
- AV fistulas

## Medications to optimize MAP = Guarding the Perfusion Pressure

### General Principles

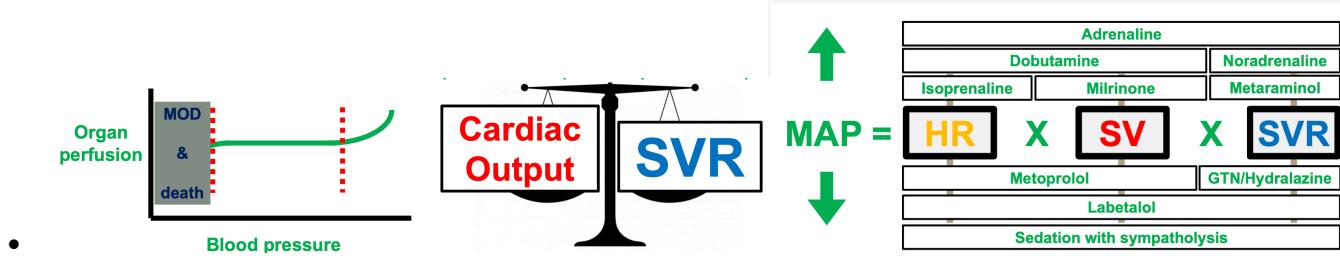

- Ensure adequate organ perfusion (MAP) to prevent end-organ dysfunction (MOD and death)

Don't forget to treat the underlying cause e.g.

- **Fluids** → hypovolaemic shock
- **Thrombolysis** (streptokinase) → massive PE
- **PCI** → cardiogenic shock due to MI
- **Adrenaline** → anaphylaxis

### Use vasoactive agents to maintain Blood Pressure

- Typically Mean Arterial Pressure (MAP) > 65 mmHg
- Metaraminol in **boluses or infusion**
- Noradrenaline or adrenaline as **infusions**

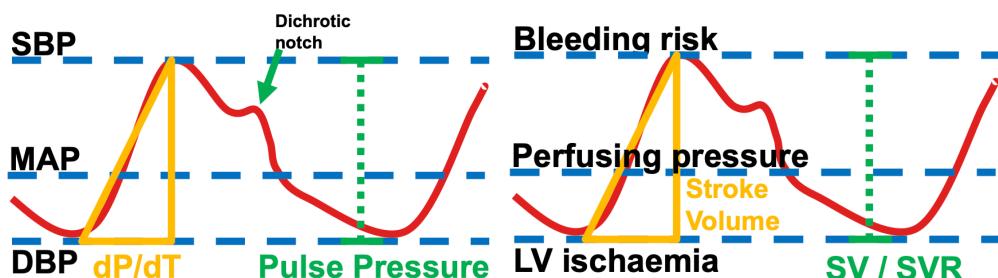

\* **Excessive** increases in either CO or SVR does **NOT** restore normal organ perfusion despite adequate blood pressure

	MoA / drug class	HR (chronotropy)	SV (inotrope)	SVR
Positive chronotropy				
<b>Isoprenaline (synthetic)</b>	B-agonist			
<b>Atropine, glycopyrrolate</b>	Anti-cholinergic			
Negative chronotropy				
<b>Labetalol</b>	NSBB + alpha blocker			
<b>Diltiazem</b>	CCB			
<b>Digoxin, amiodarone</b>	Anti-arrhythmias			
<b>Negative chronotropy + inotropy</b>				
<b>Metoprolol</b>	Cardio-Selective BB			
<b>Verapamil</b>	CCB – avoid in HF or LVF			
<b>Positive inotropy</b>				
<b>Dobutamine (Catecholamine)</b>	B agonist + chronotropic +)			vasodilator
<b>Milrinone (PD3E inhibitor)</b>	intracellular Ca <sup>2+</sup> + some chronotropic			
<b>Levosimendan (PD3E inhibitor)</b>				
<b>Positive inotropy + Vasopressor</b>				
<b>Adrenaline (Catecholamine)</b>	B agonist (low dose), A – agonist (high dose) Anaphylaxis, hypoTN			High dose
<b>Vasopressor – alpha agonists</b>				
<b>Noradrenaline (vasopressor)</b>	<b>a1 agonist - ONLY via central line IV</b>		High dose – due to high SVR increasing LV afterload to reduce SV	
<b>Metaraminol (vasopressor)</b>	<b>a1 agonist</b> - peripheral IV or bolus – causes reflex bradycardia and tachyphylaxis)			
<b>Vasodilators</b>				
<b>GTN, hydralazine</b>	Nitric oxide donors			
<b>Amlodipine, Clivadipine</b>	CCB			
<b>Prazosin</b>	a-Blocker (beware of postural HypoTN and reflex tachycardia)			
<b>FINAL RESORT</b>				
<b>Sedatives</b>	Sympatholysis – bradycardia and vasodilatation			

## CARDIAC MONITORING

	What?	Why?	How?
<b>ECG</b>	<ul style="list-style-type: none"> <li>• Rate</li> <li>• Rhythm</li> <li>• ST segments</li> <li>• PR / QT intervals</li> </ul>	<ul style="list-style-type: none"> <li>• Arrhythmias</li> <li>• Ischaemia</li> <li>• Drug toxicity</li> <li>• Electrolytes</li> </ul>	<ul style="list-style-type: none"> <li>• Repeat 12 lead</li> <li>• Continuous</li> </ul>
<b>Blood pressure</b>	<ul style="list-style-type: none"> <li>• SBP</li> <li>• DBP</li> <li>• MAP</li> <li>• Pulse pressure</li> <li>• Variations with respiration</li> </ul>	<ul style="list-style-type: none"> <li>• Vasopressor requirement</li> <li>• Risk of deterioration</li> </ul>	<ul style="list-style-type: none"> <li>• NIVBP</li> <li>• Arterial line</li> </ul>
<b>Cardiac Output</b>	<ul style="list-style-type: none"> <li>• Cardiac Index</li> <li>• ?volume responsiveness</li> <li>• ?volume overload</li> </ul>	<ul style="list-style-type: none"> <li>• Assessment</li> <li>• Response to therapy</li> <li>• Guide therapy</li> </ul>	<ul style="list-style-type: none"> <li>• ECHO</li> <li>• Pulse Contour</li> <li>• Thermodilution</li> </ul>

## ARTERIAL LINE

	Advantages	Limitations
<b>Non-invasive</b>	<ul style="list-style-type: none"> <li>• Instantly available</li> <li>• Avoids complications of arterial line</li> </ul>	<ul style="list-style-type: none"> <li>• Limited time cycle (i.e 1 per minute)</li> <li>• If required frequently <ul style="list-style-type: none"> <li>• Irritating (sleep etc)</li> <li>• Bruising</li> </ul> </li> <li>• Cannot be done over PICC lines</li> </ul>
<b>Arterial line</b>	<ul style="list-style-type: none"> <li>• Continuous monitoring</li> <li>• Phlebotomy</li> <li>• Monitor lactate</li> <li>• Additional information <ul style="list-style-type: none"> <li>• Cardiac Output</li> <li>• Respiratory variation</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• <b>Complications</b> <ul style="list-style-type: none"> <li>• Insertion (arterial injury)</li> <li>• Distal ischaemia</li> <li>• Exsanguination</li> </ul> </li> <li>• SBP and DBP may be unreliable</li> <li>• Limit patient mobility</li> </ul>

## CARDIAC OUTPUT MONITORING

	Procedure	Waveform
<b>Thermodilution CO</b>	<ul style="list-style-type: none"> <li>• Cold saline injected into central vein</li> <li>• Measures temp. change in anterograde BV <ul style="list-style-type: none"> <li>• Pulm. Artery (R heart)</li> <li>• Femoral artery</li> </ul> </li> <li>• Area under curve = inversely proportional to CO</li> </ul>	
<b>Pulse Contour Analysis - PiCCO</b>	<ul style="list-style-type: none"> <li>• Uses femoral artery line and upper body CVC</li> <li>• Check the trends</li> </ul>	
<b>Pulmonary artery catheter</b>	<ul style="list-style-type: none"> <li>• Gold standard of CO monitoring</li> <li>• Uses pressure transducer and thermistor in pulmonary artery</li> </ul> <p><i>Complications</i></p> <ul style="list-style-type: none"> <li>➢ Ruptured pulmonary artery</li> <li>➢ VT</li> </ul>	

## GENERAL ARRHYTHMIA MX:

PC: 65 M w/ 3 hrs of palpitations, light-headedness, chest pain appearing pale and diaphoretic

### Working out

1. **Fast AF**
2. **Inferior ST elevation**
3. **Anterolateral ST depression**

**Dx:** myocardial ischaemia with unstable rapid AF

#### Mx:

1. Rate control – BB, CaB
2. Rhythm control
3. ACS treatment - PCI → BB, aspirin, statin, clexane

PC: 42 F w/ altered mental state and PMHx of epilepsy presents with bradycardia and hypotension

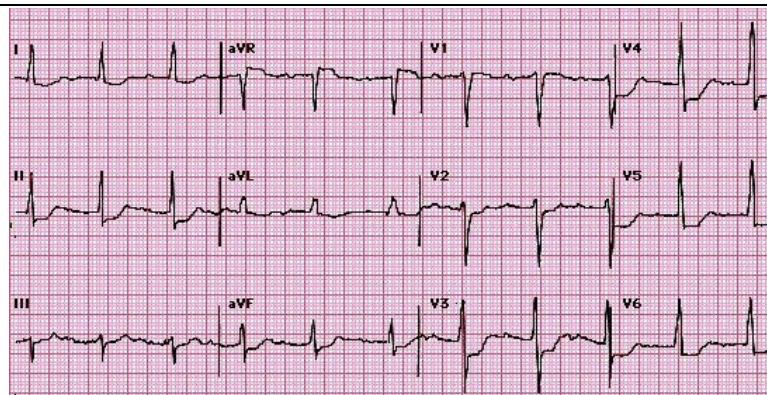

### Working out

1. **Complete heart block**
2. Inferior ST elevation
3. Lateral ST depression

**Dx:** inferior MI associated with complete heart block

#### Mx:

1. Speed up rhythm
2. PCI

PC: 85 M w/ coffee ground vomit since AM and severe epigastric pain

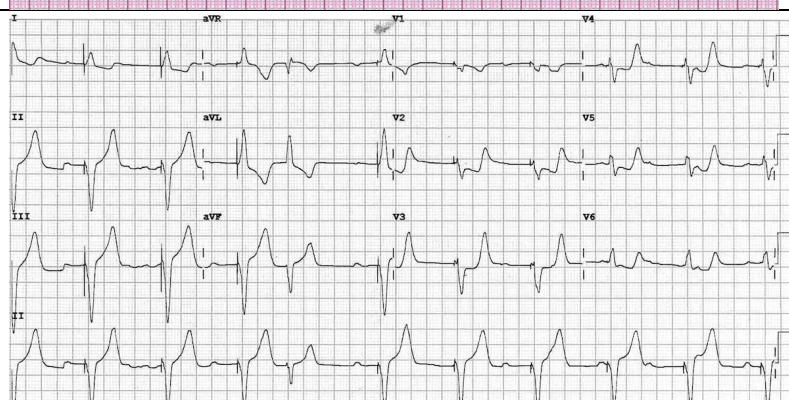

### Working out

1. **Sinus rhythm**
2. ST elevation in AVR
3. Global ST depression

**Dx:** diffuse endocardial ischaemia secondary to UGIB

#### Mx:

1. Wide bore IV access
2. Check Hb and transfuse > 80
3. PPI and endoscopy

PC: 55 F called Ambo due to chest pain. Now confused and unable to give history

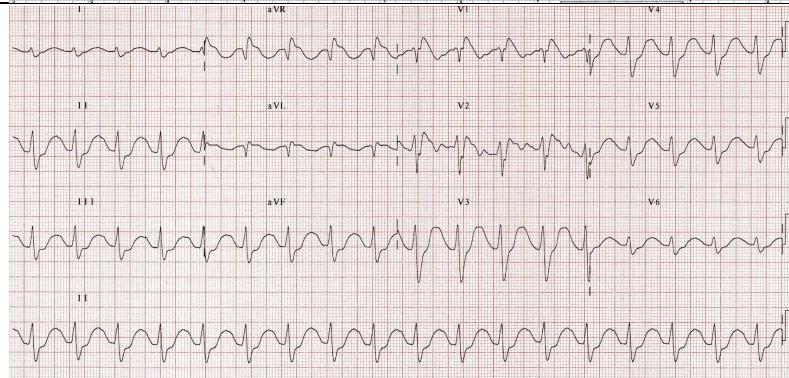

### Working out

1. **Complete heart block**
2. Left axis and LBBB morphology
3. Abnormal ST depression V2/3

**Dx:** Acute MI

#### Mx:

1. ACS protocol
2. PCI

PC: 25F found unconscious by boyfriend – intubated by paramedics but remains paralysed

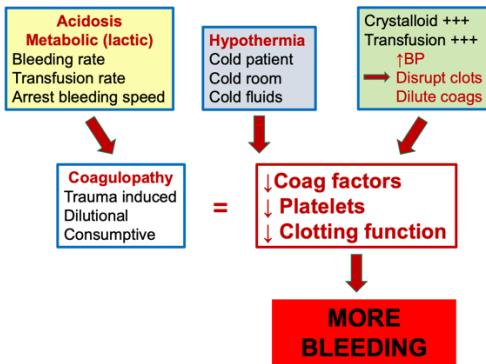

### Working out

1. **Sinus tachycardia**
2. RAD
3. Broad QRS (RBBB morphology)
4. Prolonged QT interval

**Dx:** Na channel blockade OD

#### Mx:

1. Give IV NaHCO3

## DAMAGE CONTROL = STAGED SURGERY

- Resuscitative surgery → sufficient surgery to control bleed / contamination (from orifices) and resect obvious ischaemic structures (e.g. small bowel, limb)
- Stop cosmetic surgery (e.g. stomas, generating anastomoses) → just stable organs up e.g. packing → minimise abdo compartment syndrome, infection
- Complete definitive surgery OR later reconstruction (e.g. suture)

## MASSIVE TRANSFUSION PROTOCOL (MTP)

Indications		Target / Goals	Complications of MTP = fever, chills headache		
<ul style="list-style-type: none"> <li>• pRBC = gold standard = Minimise crystalloid (e.g. Hartmann's, NS)</li> <li>• hydrocort 200mg prior to blood transfusion to prevent ADR</li> </ul>		<ul style="list-style-type: none"> <li>• Temp &gt; 35</li> <li>• ABG = &gt;7.2, BXS &gt; -6, Lactate &lt; 4</li> <li>• Ionised Ca = &gt;1.1mM</li> <li>• Plt &gt; 50</li> <li>• Hb = depends on haem status</li> <li>• INR ≤ 1.5</li> <li>• PT/APTT = &lt;1.5x normal</li> <li>• Fibrinogen &gt; 1g/L</li> </ul> <hr/> <ul style="list-style-type: none"> <li>• Restore perfusion</li> <li>• Correct cell hypoxia</li> <li>• Prevent MOF</li> <li>• Support Haemostasis</li> <li>• Avoid A/E</li> </ul>	<b>Immune</b>	Acute	Delayed
Group (O neg) to replace:				Haemolytic (DARK URINE)	Haemolytic
• 50% BV loss in 3hrs				TRALI → ARDS	Alloimmunisation
• 100% BV loss in 24 hrs				Febrile non-haemolytic (MOST COMMON)	Posttransfusion purpura
No trauma	4u pRBC + 2U FFP		Allergic	GVHD	
Trauma	PLUS TXA		<b>Non-Immune</b>	Bacterial contaminant (ESP. PLT TRANSFUSION WHICH ARE KEPT AT ROOM TEMP)	BBV (hep B/C/HIV)
Fibrinogen < 1g/L	PLUS Cryoppt (clotting factors)			Circulatory overload (TRACO)	Fe overload
Plt < 50	PLUS Plts		<b>Don't miss</b>	Electrolyte (hypo/hyperk) (HypoCa = citrate in soln increases excretion of Ca)	
				Coagulopathy	
				Hypothermia	

## When to give blood products?

Whole blood (pRBC + FFP) = 530mL (235mL + 295mL)

Product	Dosage (paediatrics)	Indication
<b>pRBC</b>	1 unit/bag (300mL) = 10g/L rise required. <ul style="list-style-type: none"> <li>• O neg = universal donor;</li> <li>• AB positive = universal acceptor</li> </ul>	<b>Hydrocort 200mg prior to blood transfusion to prevent ADR</b> <ul style="list-style-type: none"> <li>• Hb &lt;100 and high risk of myocardial ischemia</li> <li>• Severe anaemia (e.g. Hb&lt;70)</li> <li>• Major active bleeding and Hb&lt;100</li> </ul>
<b>Plts</b>	10ml/kg (1 unit ~ 60mL, 1 pooled bag = 5 units) <ul style="list-style-type: none"> <li>• 295mL of 530mL</li> <li>• <b>Raises</b> K and lactate</li> <li>• <b>Decreases</b> Ca</li> </ul>	<ul style="list-style-type: none"> <li>• &lt;10</li> <li>• &lt;20 and high risk (fever, neutropenia, antibiotics, risk of intracranial haemorrhage)</li> <li>• &lt;50 and active bleeding or requires invasive procedure</li> <li>• &lt;80 and requires neurosurgery or ophthalmic surgery</li> <li>• Plt function defects and bleeding (regardless of plt count)</li> </ul>
<b>FFP</b>	• 10 – 20 mL/kg (1 bag ~ 230mL) <ul style="list-style-type: none"> <li>• AB is the universal FFP donor. (no antibodies in plasma)</li> </ul>	<ul style="list-style-type: none"> <li>• INR &gt;1.5 <b>PLUS</b> needs invasive procedure</li> <li>• INR &gt;1.5 <b>PLUS</b> actively bleeding (e.g. massive transfusion protocol, post-bypass surgery)</li> </ul>
<b>Cryoppt</b>	5-10 mL/kg (1 bag ~ 20mL) contains <ul style="list-style-type: none"> <li>➢ Fibrinogen (factor 1)</li> <li>➢ Factor, 8, 13</li> <li>➢ VWF and Fibrinectin</li> </ul> *Thawed FFP then extracting ppt	<ul style="list-style-type: none"> <li>• fibrinogen &lt;1.0 and actively bleeding (e.g. massive transfusion protocol)</li> <li>• <b>DIC (main indication)</b></li> <li>• hereditary hypofibrinogenemia,</li> <li>• haemophilia,</li> <li>• VWF disease</li> </ul>
<b>Factor 7</b>	• 90 mcg/kg	<ul style="list-style-type: none"> <li>• rescue therapy if ongoing haemorrhage despite correction of pH and temperature, blood products to correct coagulopathy and no clear surgical cause</li> </ul>
<b>Prothrombin (F 9) complex:</b>	1mL/kg (25units/kg)	<ul style="list-style-type: none"> <li>• warfarin overdose (alternative to FFP)</li> </ul>
<b>TXA acid:</b>	100mg/kg then 10mg/kg/hr	Massive haemorrhage (PPH, Menorrhagia, GIB)
<b>Granulocyte concentrate</b>		Neutropenic sepsis

## D – DISABILITY – COMMON PRESENTATIONS #1

- **Anatomical (FRONT to back)** – sinusitis, eye (glaucoma), scalp tenderness (GCA), brain infection, raised ICP (IIH, SoL), neuralgias, neck-related (referred pain), ear-related (otitis media), muscle related
- **Red-flag** – stroke, bleed, infection (fever), sudden onset headache, LOC
- **Non-related** – migraines, TTH, cluster

### A Case

JASMINE

- 32 year old – Severe headache
- 1 week post partum
- G5P5
- Obstetric Hx complicated by severe HT
- C sec for HT at 34 weeks
- Epidural for C sec
- D/C for 4 days
- Since last day in hospital has had nausea, feeling generally unwell
- Worsening severe headache

### A Case

MOHABIK

- 32 year old male** - Headaches for 1 week
- Moderate, not worst headache ever
- Wakes at night with pain
- Wakes at night to vomit
- Pain worse in the morning
- No neurology
- Pain completely resolves with paracetamol

### A Case

AJ

- 8 year old boy
- Fevers 1/7
- 1<sup>st</sup> Seizure at home self terminated
- Seizure in ED
- No PHx,
- 1 uncle with epilepsy
- No meds
- No allergies
- IUTD

## D – DISABILITY – COMMON PRESENTATIONS #2

		CVA	ICH	Vertigo/Dizziness
<b>Sx</b>	<ul style="list-style-type: none"> <li>➤ LOC</li> <li>➤ FND</li> </ul>	Sudden onset FND, reduced LOC, photophobia Headache (thunderclap, exertional)		Is it vertigo or dizziness? ➤
<b>RF</b>	• Vascular-pathology – T2DM, anti-coags	<ul style="list-style-type: none"> <li>• Trauma</li> <li>• Meds - Anti-coag usage</li> </ul>

## A Case

21 year old Sebastian presents to country hospital

- Severe sudden onset headache, BP 140/90, PR 115
- Take and Hx and Ex

Manage this patient, DDx

- Patient transferred to neurosurgical team big city center, BP 130/85, PR 95
- Every imaging you can think of CTs, MRI, body scans, contrast, PET
  - Small lesion basal ganglia, possibly slow growing malignancy, ?calcified bleed from birth

Manage this patient, DDx

- Managed on wards for headaches, BP 160/95, PR 95
- Agitation, request hot showers, family aggressive and confrontational
- Lignocaine infusion for headache, mental health team involved
- TF back to country hospital

Manage this patient, DDx

- Unable to get repeat imaging TF to slightly less country hospital with the ability to MRI
- Sweaty, BP 170/100, PR 120, afebrile, request hot shower

Manage this patient

## D – ULTRASOUND TIPS #1

<b>SCENARIO</b>	<b>QUESTIONS</b>	<b>USS ACTIONS</b>	<b>C</b> Continue Compressions and Echo
<b>CARDIAC ARREST</b>	<ul style="list-style-type: none"> <li>Is it reversible? (4 H's and 4 T's)</li> <li>Are both lungs ventilating</li> </ul>	<ul style="list-style-type: none"> <li>Heart (tamponade, LVH, or reduced contractility)</li> <li>Lungs</li> <li>Elsewhere - IVC, AAA, free fluid</li> </ul>	<b>O</b> Oxygen Away
<b>SHOCKED PATIENT</b>	<ul style="list-style-type: none"> <li>Why is patient in shock?</li> <li>Do they need fluids?</li> </ul>	<ul style="list-style-type: none"> <li>Anterior lungs – wet, dry, chunky?</li> <li>IVC – full or empty</li> <li>Heart</li> <li>Elsewhere - IVC, AAA, free fluid</li> </ul>	<b>A</b> All Else Stand Clear
<b>BREATHLESS PATIENT</b>	<ul style="list-style-type: none"> <li>Why are they breathless?</li> </ul>	<ul style="list-style-type: none"> <li>All of the lungs – wet, dry, chunky?</li> <li>IVC</li> <li>Heart</li> <li>Scan for DVT – upper femoral/lower femoral, popliteal or below knee</li> </ul>	<b>C</b> Charge Defibrillator <b>H</b> Hands Off Compressions <b>R</b> Rhythm Check/Record Echo <b>E</b> Echo Off <b>D</b> Deliver Shock OR Dump Charge

### Z GOLDEN RULES FOR USS

- 'Resus-only' (critically unwell: shocked / breathless / peri-arrest to elicit US signs of some diseases e.g. massive PE or pneumonia)
- Clinical Diagnosis BEFORE US (e.g. FBC with Hb = 4)
- Only ask questions that you can answer
- Repeat scans are crucial (change over time)
- USS are NOT 100% accurate
- When in doubt, be a doctor (clinical picture > USS findings)
- A fool with a stethoscope will be a fool with an ultrasound

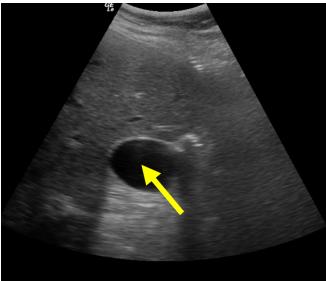

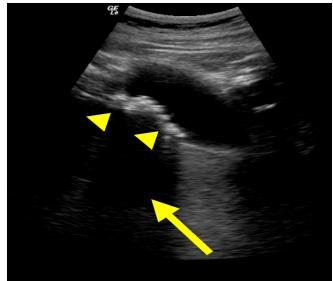

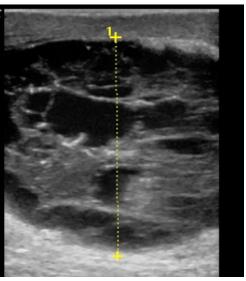

### WHICH PROBE TO USE?

			
<b>Probe type</b>	<b>Curved (curvilinear) array</b>	<b>Linear array</b>	<b>Sector (Phased) array</b>
<b>Indication &amp; preset</b>	<b>Deep tissue visualisation</b> <ul style="list-style-type: none"> <li>Lung (pneumothorax, effusion)</li> <li>Heart (subcostal window)</li> <li>Abdomen (abdo, eFAST, AAA, early pregnancy)</li> <li>IVC</li> </ul>	<b>Superficial tissue visualisation</b> <ul style="list-style-type: none"> <li>Lung pleural surface ONLY</li> <li><b>Vascular access</b> (vascular / venous preset)</li> </ul>	<ul style="list-style-type: none"> <li><b>Lung</b> (pneumothorax, effusion)</li> <li><b>Heart</b> (subcostal window)</li> <li><b>Between ribs</b> (Cardiac present – Nb: image wrong way around)</li> </ul>

### TIPS TO IMPROVE IMAGE

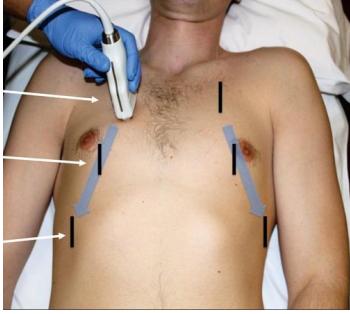

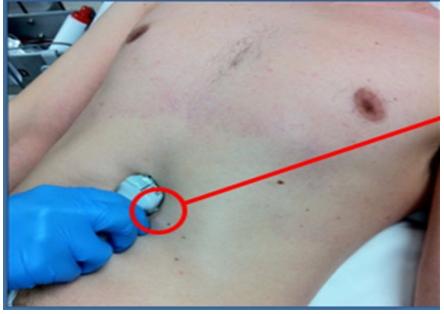

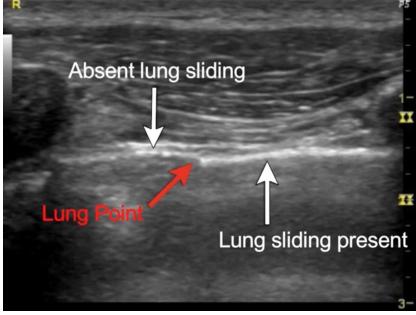

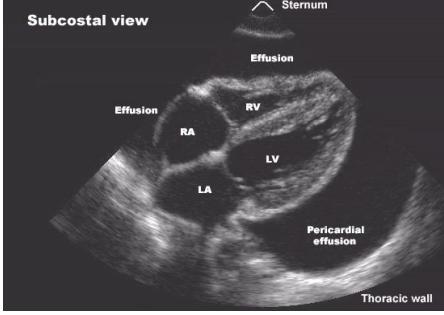

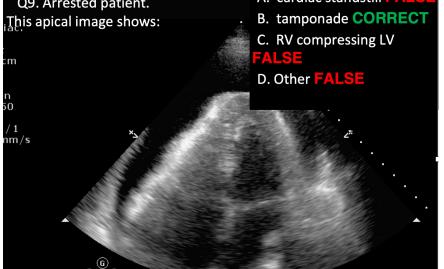

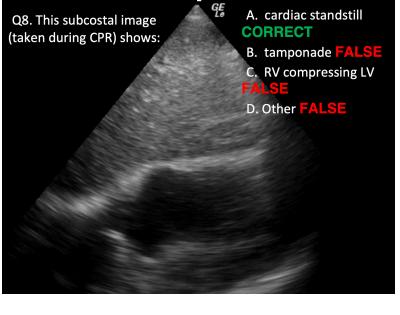

- Use **MORE gel** (reduce reflection at surface of skin)
- DARK room
- Correct patient position
- Right probe and preset
- Correct probe orientation
- Set depth (deeper than structure you're scanning)
- Set adequate gain (fluid just appears black – to differentiate between fat and fluid)
- Highest frequency = better resolution (low frequency = for obese patients)**

### Interpretation of images:

			
Bile in GB = black (anechoic) <b>Below brighter</b> = posterior acoustic enhancement	Stones in GB (HYPER echoic) Casts posterior acoustic shadow	Ascites (simple fluid) (kidney is below)	SC abscess
<b>Curved probe</b>	<b>Curved probe</b>	<b>Curved probe</b> = Paracentesis – watch out for ➢ Inferior epigastric arteries ➢ diaphragm	<b>Linear probe</b>

**'BEWARE OF anisotropy (esp. nerves)** → specific orientations to better visualise structures

## D – ULTRASOUND TIPS #2

		
<b>Lung USS</b>	<b>Cardiac USS</b>	<b>Vascular Access</b>
Curvilinear	Sector probe (to fit b/w ribs) ➤ subcostal position	➤ Linear probe ➤ Use BP cuff as tourniquet ➤ <b>Always use LONGER cannulas</b>
<ul style="list-style-type: none"> <li><b>Pneumothorax</b> (NO lung sliding)</li> <li><b>Fluid/effusion (image 2)</b> <ul style="list-style-type: none"> <li>o B lines</li> <li>o Rockets and comets</li> </ul> </li> </ul>	<b>For critically unwell patients</b> <ol style="list-style-type: none"> <li>1. Check Heartbeat</li> <li>2. Effusion → ?tamponade</li> <li>3. RV bigger than LV → big PE</li> <li>4. Normal → may need move volume</li> </ol>	➤ Cannulation of difficult veins
 	 	 <b>Cardiac Standstill</b>

In ALS → Use either curvilinear or sector probe (whichever convenient) → aim to rule out 4 H's and 4 T's

## D – MANAGING DIFFICULT SITUATIONS → “SPIKES”

### Setting

- Turn off phone
- Sit on chair
- Make sure the patient is with a supportive person
- Avoid presumptions

### Consider your patient

- Know their name!
- Review their notes prior to any discussions, know as much as you can know

### Consider your audience

- Are you talking to a patient?
- Know who you will be addressing if possible before meeting

### Consider your news

- Is it a complete shock?
- Should you use a “warning shot”. Tell them what you want them to know first, before anything shocking
- People will forget everything you said after the bad news breaks → need to see the word death or your mum/dad/son is dying

### SPIKES PROTOCOL

**S:** → Setting up the interview:  
create privacy, involve significant others  
make connections

**P:** → Assess the family perception:  
open ended questions

**I:** → Invitation: how does the family  
want to hear the information

**K:** → Knowledge sharing:  
nontechnical terms

**E:** → Emotions: respond to family's emotions

**S:** → Strategy and Summary;  
determine if family is ready for  
more discussion and action

### On the phone

- Do not say patient had died on the phone
- Please come in as \_\_\_\_\_ is critically unwell.

### Finishing up

- Offer social worker support
- Give time to process

## E - TRAUMA: Primary Survey

### What is a trauma patient?

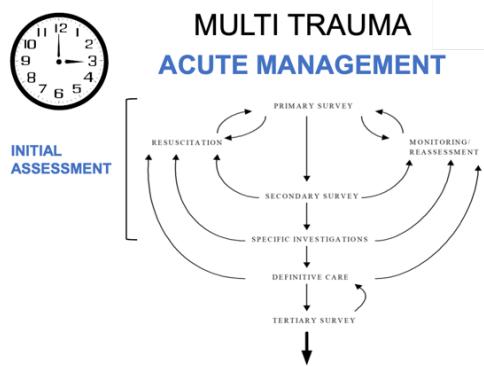

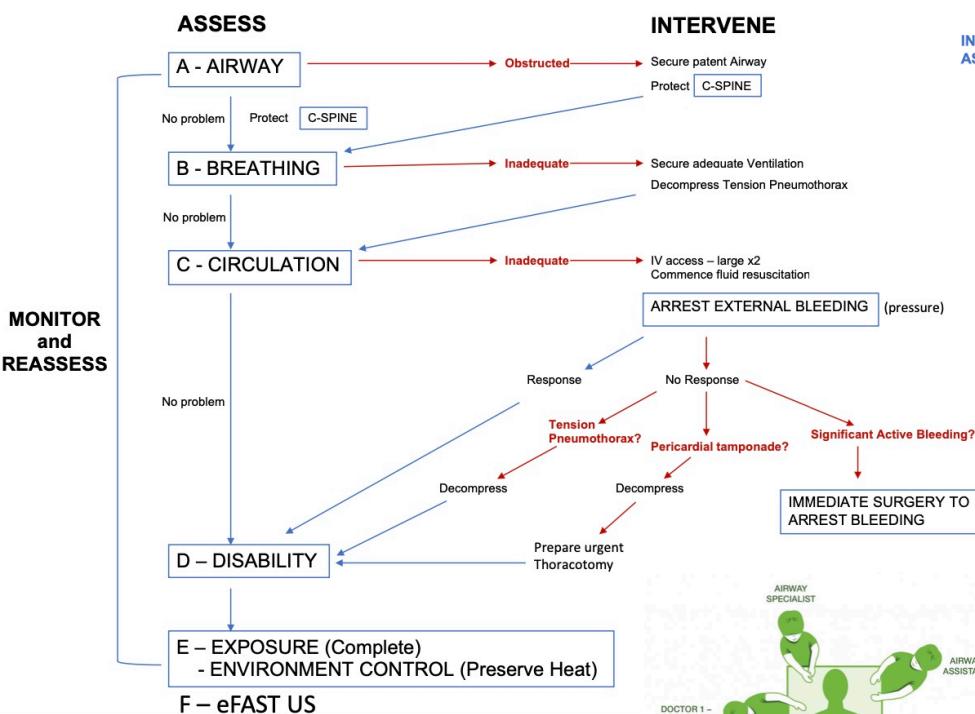

- **High impact** = MVA, MBA, Plane crash,
- **Penetrative** = Stabbing, shooting
- Significant fall (esp. elderly)

### What do I consider?

- Collateral hx (ambos, police, bystanders)
- AMPLE
  - o Allergies, meds, PMHx (diabetes, vascular, collagen diseases),
- What happened before event? During trauma? And after? (i.e. what was given as Rx)

Groups	Special Considerations	Intervention
<b>Children</b> 	<ul style="list-style-type: none"> <li>• Leading cause of death</li> <li>• Immature, anatomic/ mechanical features</li> <li>• Vigorous physiologic response</li> <li>• Limited physiologic reserve</li> <li>• Consider: Size, dosage, equipment, SA, and psychology</li> </ul>	<ul style="list-style-type: none"> <li>• <b>A:</b> Larynx anterior and cephalad, short tracheal length</li> <li>• <b>B:</b> Chest wall pliability (contusions may not present)</li> <li>• <b>C:</b> Vascular access, fluid volume, vital signs, and urinary output</li> <li>• <b>D:</b> Vomiting, seizures, and diffuse brain injury</li> <li>• <b>MSK:</b> Immature skeleton, fracture patterns</li> </ul>
<b>Pregnancy</b> 	<ul style="list-style-type: none"> <li>• Anatomic/ physiologic changes modify response to injury</li> <li>• Need for fetal assessment</li> <li>• <b>1st Priority: Maternal resuscitation</b> <ul style="list-style-type: none"> <li>o Identify early shock</li> <li>o X-ray mother</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• Gestation and position of uterus</li> <li>• Physiologic anaemia</li> <li>• ↓ Pco<sub>2</sub></li> <li>• ↓ Gastric emptying</li> <li>• Supine hypotension</li> <li>• Isoimmunization (Anti-D for Rh -ve mothers)</li> <li>• Sensitivity of fetus</li> </ul>
<b>Elders</b>	<ul style="list-style-type: none"> <li>• 5<sup>th</sup> leading cause of death</li> <li>• Diminished physiologic reserve and response</li> <li>• <i>Co-morbidities:</i> Diseases / Meds</li> </ul>	
<b>med</b>	<ul style="list-style-type: none"> <li>• BB may hide tachycardia</li> <li>• <b>Intoxicated</b></li> </ul>	Drug screen Safety of myself and others
<b>athletes</b>	<ul style="list-style-type: none"> <li>• normal HR when actually tachycardic</li> </ul>	Low threshold to admit to ICU

## PRIMARY SURVEY

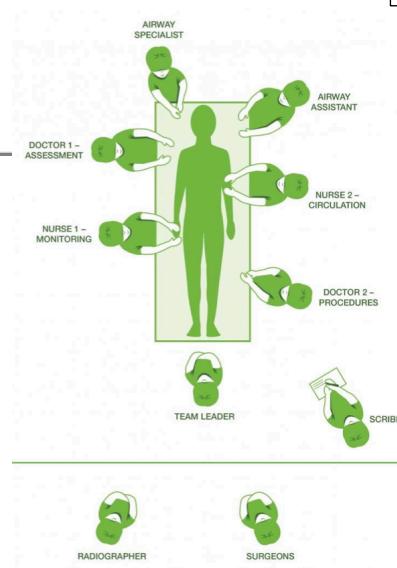

**BEWARE: Trauma-induced coagulopathy (TIC)**

- **Acute traumatic coagulopathy (ATC)**
  - o Hyperfibrinolysis
  - o Fibrinogen loss
  - o Plt dysfunction/disaggregation
- **Resuscitative coagulopathy (iatrogenic)**
  - o Due giving too much fluid free of coagulation factors
  - **Prothrombotic phase**

**Solution**

- **Reduce crystalloids** → 1:1:1 ratio → RBC:plt:plasma
- **Permission hypotension** (i.e. accept low borderline BP)
- **Damage control surgery**
- **Blood & coags**

## E - Secondary Survey – “Top to toe”

History	Exam	Do the following:
<ul style="list-style-type: none"> <li><b>A</b> Allergies</li> <li><b>M</b> Medications</li> <li><b>P</b> Past illnesses / Pregnancy</li> <li><b>L</b> Last meal</li> <li><b>E</b> Events / Environment</li> </ul> <p>GCS Scalp Ears (incl TMJs) Eyes (incl pupils/ acuity/fundi) Facial bones Mouth Neck C-spine</p> <p>Clavicles Chest wall Breath sounds Heart sounds Abdomen Pelvis</p> <p>Hips Knees Legs Ankles Feet</p> <p>Shoulders Upper arms Elbows Forearms Wrists Hands Fingers</p> <p>Back (incl spine) and flanks (log roll) Perineum Genitalia Rectal exam Urinalysis</p>	<ol style="list-style-type: none"> <li>1. Head → ENT → Neck (uncover any c-cover)</li> <li>2. Chest -</li> <li>3. Abdo</li> <li>4. Pelvis</li> <li>5. Extremities (upper → lower)</li> </ol> <p><b>Seek the following:</b></p> <ul style="list-style-type: none"> <li><b>Bleeding</b></li> <li><b>Swelling</b> (incl. haematoma)</li> <li><b>Tenderness</b></li> <li><b>Lacerations</b> (incl. entry/exit)</li> <li><b>Deformity</b> (bones)</li> <li><b>Discolouration</b></li> <li><b>Crepitus</b> (incl. subcutaneous)</li> <li><b>Pulse - Ischaemia</b> (limbs)</li> <li><b>Functional impairment</b> <ul style="list-style-type: none"> <li>Neurological (power, tone, reflexes)</li> <li>Viscera (lungs, heart, GIT)</li> <li>MSK</li> </ul> </li> </ul>	<p><b>1) Stop bleeds</b></p> <ul style="list-style-type: none"> <li>IVF,</li> <li>pressure on wound,</li> <li>pelvic binders,</li> <li>reduce fractures with traction</li> </ul> <p><b>2) Stop pain</b> = Analgesia (IV morphine)</p> <p><b>3) Stop infection</b></p> <ul style="list-style-type: none"> <li>ABx or tetanus prophylaxis,</li> <li>Sterile pads on wounds</li> </ul> <p><b>Adjunctive things to do:</b></p> <ul style="list-style-type: none"> <li>Photo major wounds</li> <li>Bedside → UA, ECHO</li> <li>Bloods</li> <li>Imaging → X-ray, CT</li> <li>Invasive → Bronchoscopy, oesophagoscopy</li> <li><b>Do NOT delay transfer to 3<sup>o</sup> hospital (trauma centre) – bring relevant imaging and results</b></li> </ul>

\*NB: Tertiary survey avoids MISSED injuries → (repeat 1<sup>o</sup>, 2<sup>o</sup>, relook at imaging/tests etc.)

- Within 24 hrs** (repeat primary and secondary survey and any imaging) → PROCEED TO NEW IMAGING
- DO NOT MISS** → Mild TBI, PNI, C-spine #, bowel injury, knee ligament ruptures, acromioclavicular dislocation

## Trauma Triaging

### Multi-tasking: Do it once and do it correctly!

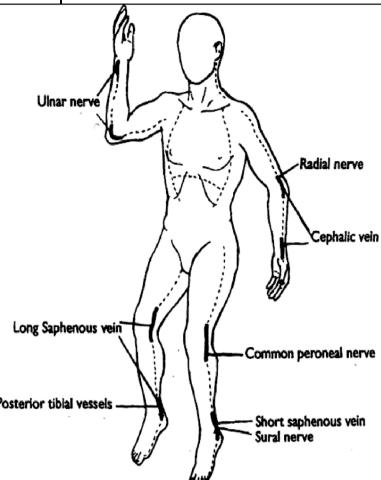

- Get line in and bloods prior to hx – get ALL the tubes
- Prepare lubricants for DRE for PR bleeding
- Vag speculum exam for PV bleeding

Causes	Good trauma system	Trimodal Death distribution
<ul style="list-style-type: none"> <li><b>Blunt</b> (road accidents, fall, blast)</li> <li><b>Penetrating</b> (stab/impale, gunshot)</li> <li><b>Burns</b></li> <li><b>Electrocution</b></li> <li><b>Chemical</b></li> </ul> <p><b>Combination of above</b></p> <ul style="list-style-type: none"> <li>Don't be distracted from the occult → what is most life-threatening?</li> </ul>	<ul style="list-style-type: none"> <li>Minimise time from injury to care</li> <li>Prioritise patient's threat to life and disability</li> </ul> <p><b>Preparation crucial</b></p> <ul style="list-style-type: none"> <li>Get team ready &amp; wear protective equipment (e.g. protect against BBV – Hep B/C, HIV)</li> </ul> <p><b>Timeline for multi-trauma:</b></p> <ul style="list-style-type: none"> <li>1<sup>st</sup> hr = critical initial assessment &amp; resus</li> <li>2<sup>nd</sup> hr = definitive care</li> <li><b>Treat the cells!</b> → STOP ISCHAEMIA (hypoperfusion) → INFARCT (cellular response to ↓perfusion)</li> </ul>	<p>The graph illustrates the trimodal distribution of trauma deaths. The y-axis represents the 'Number of deaths' from 0 to 400. The x-axis represents 'Time after injury' in hours and weeks. The first peak, 'Immediate deaths', occurs within the first hour and is represented by a yellow bar. The second peak, 'Early deaths', occurs between 1 and 4 hours and is represented by a red line. The third peak, 'Late deaths', occurs between 2 and 5 weeks and is represented by a green bar.</p>

TRAUMA SERVICES PLANNING	REGIONAL TRAUMA CARE SYSTEMS	TRAUMA SERVICE COMPONENTS	Trauma Team
<ul style="list-style-type: none"> <li>Population</li> <li>Trauma frequency</li> <li>Existing resources</li> <li>Transport times</li> <li>Geo-political issues</li> <li><b>Major Trauma Services/Hospitals</b> (e.g. John Hunter, St George, RPA)</li> </ul>	<ul style="list-style-type: none"> <li><b>Pre-hospital services</b> <ul style="list-style-type: none"> <li>Transport</li> <li>Communication</li> </ul> </li> <li><b>Acute hospital services</b></li> <li><b>Rehabilitation services</b></li> <li><b>Interhospital transfer processes</b></li> <li><b>Specialist centres:</b> <ul style="list-style-type: none"> <li>Burns</li> <li>SCI</li> </ul> </li> </ul>	<p><b>Need good communication</b> b/w:</p> <ul style="list-style-type: none"> <li>Emergency Medicine</li> <li>Surgery</li> <li>Intensive Care/Anaesthetics</li> <li>Operating Suite</li> <li>Radiology</li> <li>Blood Bank</li> <li>Allied Health</li> <li>Rehabilitation</li> </ul>	<ul style="list-style-type: none"> <li>Emergency Medicine Registrar</li> <li>3 RN's from Emergency Department</li> <li>ICU Registrar</li> <li>Trauma Fellow</li> <li>Trauma Nurse Co-ordinator</li> <li>Surgical Registrar</li> <li>Radiographer</li> <li>Social Worker</li> <li>Blood bank on standby</li> </ul>

<b>Burn erythema (1<sup>st</sup> deg)</b> Bad sunburn • <b>Painful</b> • No scarring <b>Rx: aloe vera!!</b> , burnaid	<b>Partial Thickness (2<sup>nd</sup> deg)</b> Blisters (less deep) Cherry red (more deep) Blanches Hair Intact Painful (dermal pain nerves injured)		<b>Full thickness (3<sup>rd</sup> deg)</b> Pale Feels like leather, does NOT blanch, hair loss Painless (cutaneous nerve "killed")	<b>Circumferential Full thickness</b> • <b>ALL the way around</b> • Loss of dermal compliance (flexibility) • Skins becomes like a tourniquet causing ischaemic limb, SOB (torso)

## Trauma Day – BURNS calculating resuscitation fluids

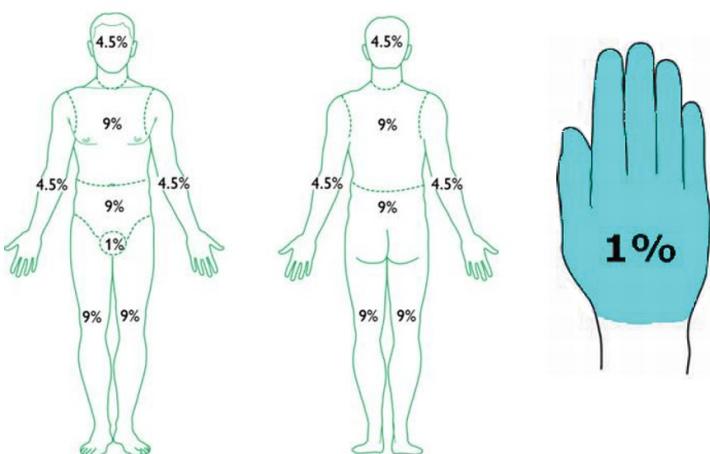

### Steps

1. **Calculate %TBSA** – Adults ≥ 20% or child ≥ 10%
2. **Parkland's formula** (see below)
3. **IVF – Hartmann's (to minimise K loss)**
4. **Check IDC – urine output**

2-4ml x (ideal) weight (kg) x %TBSA  
- 50% in first 8 hrs  
- 50% in next 16 hrs  
titrate to urine output – adult = 0.5ml/kg/hr

### What happens if it does not work? Eschar?

- **Eschar** – tough, inelastic mass of burnt tissue (secondary from full thickness circumferential burns)
- **Compartment syndrome** = eschar + swelling (i.e. circumferential burns)
  - Vascular compromise of limb (distal ischaemia)
  - Impending / actual respiratory compromise
- **Treat with escharotomy**
  - Life-saving procedure – improve blood flow
  - Incise tissue along predefined escharotomy lines

### Rule of 9's:

\***ONLY** includes 2<sup>nd</sup> and 3<sup>rd</sup> degree burns

\*Not used for children (which uses rule of 5's)

## Case Study: Acute Trauma:

1. A 26 yr old healthy man was riding a motorcycle which collided with an SUV. He has just been brought to hospital by ambulance. He seems alert, appears pale and distressed and is complaining of severe pain in his R leg. His vital signs are P 120, BP 100/80, RR 20/min. The ambulance officers report that he has swelling and deformity of his right thigh and that his right foot is pale and cold. He also has laceration to his L upper arm, to which a dressing and bandage have been applied to stop bleeding.

<ul style="list-style-type: none"> <li>Haemorrhagic shock secondary to Shaft of femur #</li> <li>Nb: NOF# = Shortened leg + ER</li> </ul> <p><b>Key findings</b></p> <ul style="list-style-type: none"> <li>Hypotension – hypovol.</li> <li>Tachycardia - compensating for hypoTN to maintain CO</li> </ul> <p>R) Pale/cold foot → ischemic foot (risk of amputation)</p> <ul style="list-style-type: none"> <li>Vascular injury = Suggests bleed from superficial femoral artery which drains down into popliteal artery</li> </ul>	Get help – surgical reg A – patent B – breath sounds, FiO2 (NP) C – IV Access (2x large bore cannulas) <ul style="list-style-type: none"> <li>IVF – 500mL 0.9% NS</li> <li>Bloods – FBC, EUC, LFT, COAG + GROUP + X-MATCH</li> <li>IV Analgesia - morphine</li> <li>IV anti-emetics -</li> </ul> D – GCS and BSL E – Secondary survey → hypothermia (need warm blankets) <ul style="list-style-type: none"> <li><b>Traction on leg to straighten shortened segments of femur</b> (prevents ischaemia and compartment syndrome)</li> <li><b>Angiography + stent OR ORIF (restore femur alignment)</b></li> <li>Maintain pressure on bandage dressing until haem stable</li> </ul>

2. A 18yr old young woman was crossing the road when hit by a car travelling at about 50km/hr. She was thrown sideways and impacted the guard rail on the side of the road. She has been complaining of abdominal pain during her ambulance transport to the hospital. En route she has been a bit confused, BP has fallen from 110 syst to 90. She looks quite pale and her hands are cool and clammy while her vital signs are P130, BP 85/60, RR 28/min. Her airway is clear and her chest looks and sounds normal (i.e. equal breath sounds on both sides) but her abdomen appears a bit distended and is quite tender across the upper region.

DDx	Mx	Other Mx
<b>Haemorrhagic shock</b> secondary to: <ul style="list-style-type: none"> <li>Haemothorax</li> <li>Intra-abdo bleed</li> <li>Long-bone #</li> <li>Pelvic #</li> <li>External losses</li> </ul> <p><b>Key findings</b></p> <ul style="list-style-type: none"> <li><b>Confused</b> <ul style="list-style-type: none"> <li>?brain injury</li> <li>?Cerebral hypoxia</li> <li>?EtOH/drugs</li> </ul> </li> <li>HypoTN → pale/cool → <b>Vasocstriction and peripheral shutdown</b></li> <li>Tachypnoea</li> <li>Abdo distension</li> </ul>	Get help – resus bay A – patent B – breath sounds, FiO2 (NP) C – IV Access (2x large bore cannulas) <ul style="list-style-type: none"> <li>IVF – 500mL 0.9% NS</li> <li>Bloods – FBC, EUC, LFT, COAG + GROUP + X-MATCH</li> <li><b>O-ve (universal donor blood)</b> → while waiting for donor blood</li> </ul> D – GCS assessment and BSL E – Secondary survey → hypothermia (need warm blankets) <ul style="list-style-type: none"> <li>CXR – tension pneumothorax + multiple rib #, intrapleural bleed</li> <li>Pelvic XR – hip # and long bone #</li> <li><b>Pelvic ring binder</b></li> <li>eFAST → assess internal abdominal trauma + pericardial and pleural cavity <ul style="list-style-type: none"> <li>mobile mesenteries (transverse, sigmoid, small bowel mesentery)</li> <li>spleen or liver rupture</li> </ul> </li> <li>Seek additional ICU help → insertion of chest drain</li> </ul>	Consider: <ol style="list-style-type: none"> <li><b>Urethral bleed</b> → DRE → check prostate position (high-riding) → urethrogram <b>BEFORE</b> IDC or SPC</li> <li><b>CT angiogram</b> via descending aorta → identify extravasation</li> <li><b>MTP protocol</b> (pRBC : plt : FFP) → &gt;4 U blood required</li> </ol>

3. While removing a fallen tree branch from his roof, a 73 yr old man fell about 3 metres from a ladder and landed on the ground on his right side. He was able to get up but noted sharp pain in his right chest when he breathes. As he began to feel short of breath, an ambulance was called to bring him to hospital. He is alert but anxious and slightly cyanotic around his mouth. His airway is clear but his RR is 30/min, while his other vital signs are P120/min and irregular and BP 100/70. There is a crackling sensation to palpation and auscultation over his right chest and breath sounds are difficult to hear on that side but seem normal on the left side.

4. Woman aged 33yrs was struck in the head and knocked unconscious by a baseball during a regional competition. She appeared to recover quickly but 10 minutes later she collapsed and has been rushed to hospital. She has a patent airway and is breathing normally. Vital signs are P 90, BP 110/70, RR 15/min. She responds to painful stimuli but not to voice. She has mild swelling over the left temporal area of her head. After Primary and Secondary Surveys, there do not appear to be any other injuries.
